RE: Modera West Linn Traffic Impact Analysis

Executive Summary

MCRT Investments LLC is proposing to develop approximately 320 apartments and 10,520 square feet of neighborhood retail space (Project) at a site located north of Blankenship Road to the west of Tannler Drive in the City of West Linn (City). The proposed development includes a realignment of the southern portion of Tannler Drive through the site to Blankenship Road.

The development of the site necessitates preparation of a Traffic Impact Analysis (TIA) per the City's Community Development Code (CDC) Section 85.170(B)(2)(d) requirements. This study documents the analysis methodology, findings, and recommendations.

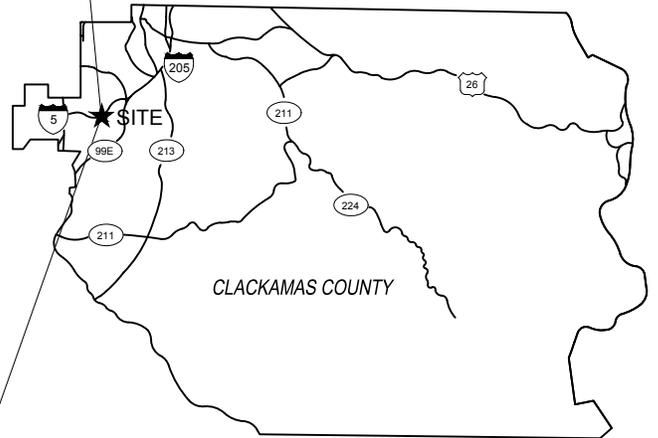

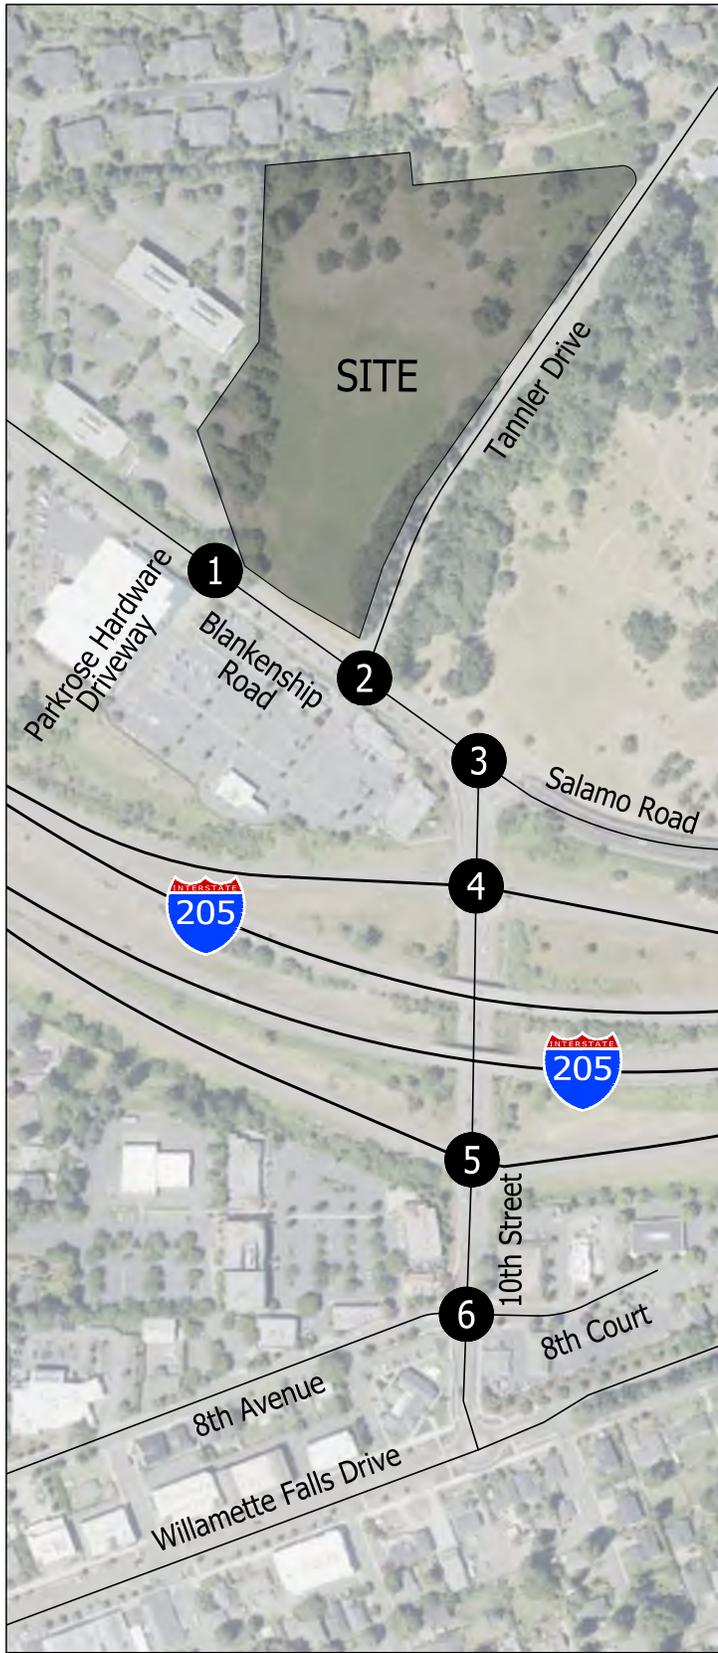

As discussed herein, the proposed uses can be constructed and occupied while maintaining acceptable operations at the study intersections and access points, assuming provision of the following recommendations in conjunction with site development (subject to City and Oregon Department of Transportation (ODOT) approval).

- Construct a southbound right-turn lane with at least 75 feet of storage and a separate shared through/left-turn lane on the proposed relocated Tannler Drive at its intersection with Blankenship Road.
- Construct a traffic signal at the relocated Blankenship Road/Tannler Drive intersection prior to the occupancy of the proposed homes.
- Place and maintain all vegetation, landscaping, and above ground objects adjacent to the site access points, local street intersections, along the public street site frontage, and throughout the site to provide adequate minimum sight distance in accordance with the City requirements.

Introduction

Figure 1 provides the project vicinity map, and Figure 2 provides the site plan. The proposed realignment of Tannler Drive opposite the easternmost Parkrose Hardware Driveway on Blankenship Road is consistent with the City's Transportation System Plan (TSP, Reference 1).

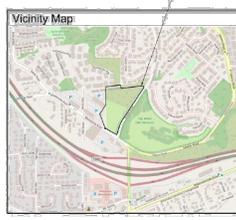

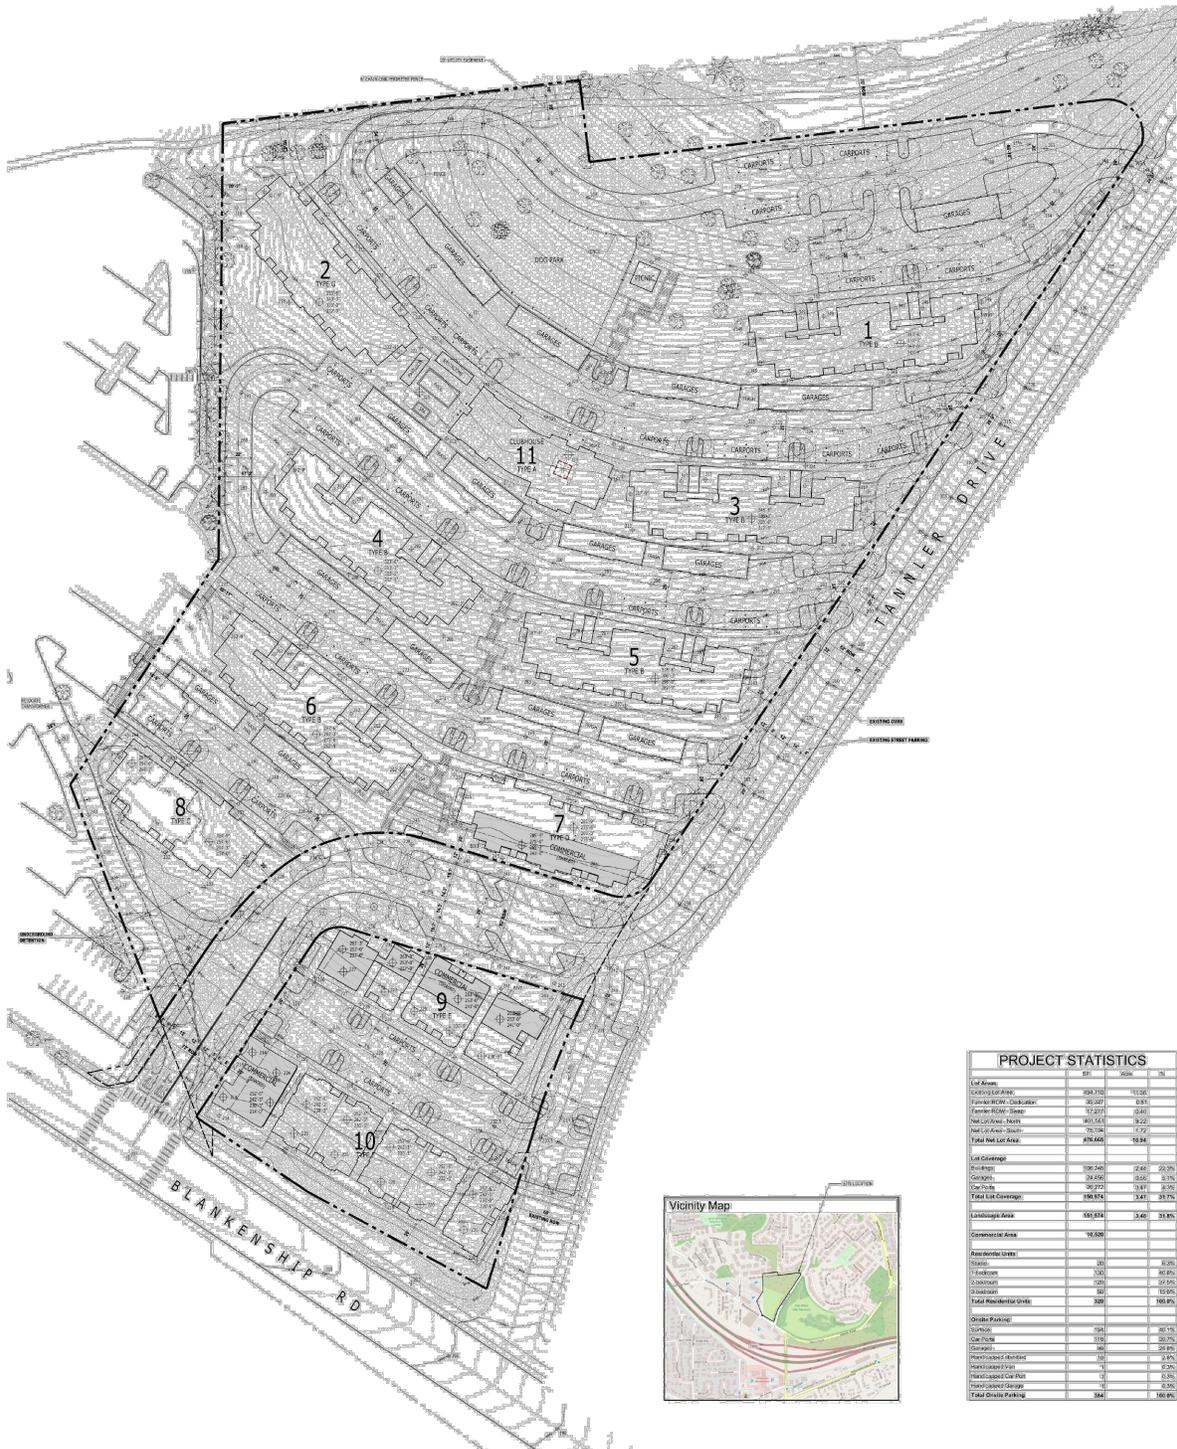

Full occupancy of all the uses on-site is anticipated in February 2029.

SCOPE OF THE REPORT

This report identifies the transportation-related impacts associated with the proposed mixed-use development. The study intersections and scope were determined per the requirements outlined by CDC Section 85.170(B)(2)(d) and direction provided by the City and ODOT staff. *The scoping memorandum is provided in Appendix A.*

The CDC requires analysis of all points of access onto the public street system, all intersections of arterials, collectors, and neighborhoods routes within 1,000 linear feet from all points of access onto the public street system, and all intersections where the traffic generated by the proposed development exceeds five percent of existing AM or PM peak hour total intersection traffic volume. In addition, ODOT requires additional analysis when intersections under its jurisdiction receive more than 50 peak hour trips as the result of a proposed land use action.

Accordingly, operational analyses were performed at the following study intersections during the weekday AM and PM peak periods (numerical identification refers to figures in this report):

1. Blankenship Road/Parkrose Hardware Driveway/Office Driveway
2. Blankenship Road/Tannler Drive;
3. Blankenship Road/Salamo Road/10th Street;
4. 10th Street/Interstate 205 Southbound Ramp;
5. 10th Street/Interstate 205 Northbound Ramp; and,
6. 10th Street/8th Avenue/8th Court.

This report addresses the following transportation topics:

- Existing land use and transportation system conditions within the site vicinity during the weekday AM peak and PM peak periods, including study intersection volume-to-capacity (V/C) ratio and level-of-service (LOS);
- Crash data analysis for the most recent five-year period with complete data;
- Forecast year 2029 background traffic conditions during the weekday AM peak and PM peak periods, considering previously approved developments and funded changes to the transportation system;
- Trip generation and distribution estimates for the proposed development;
- Forecast year 2029 full buildout traffic conditions during the weekday AM peak and PM peak periods, assuming occupancy of the proposed buildings; and,
- Traffic control and lane geometry needs at the realigned Tannler Drive/Blankenship Road intersection.

ANALYSIS METHODOLOGY

The intersection operational analysis was conducted using the procedures outlined in the *Highway Capacity Manual 7th Edition* (HCM, Reference 2) using the PTV Vistro 2025 software.

INTERSECTION PERFORMANCE METRICS

Per the City's *Public Works Design Standards* (PWDS, Reference 3) Section 5.0014(G), the City requires all intersections within the study area to maintain an acceptable level of service (LOS) upon buildout of the proposed land use action. The minimum acceptable LOS for signalized intersections is "D" or better for the intersection as a whole. No approach should operate at worse than LOS "E", and a V/C ratio not higher than 1.0 is required for the sum of critical movements. The minimum acceptable LOS for non-signalized intersections is "E" or better for the poorest operating approach. No movement serving more than 20 peak hour vehicles should operate at worse than LOS "E". LOS "F" will be tolerated for minor movements during a peak hour.

Study intersections #3, #4, #5, and #6 are under the jurisdiction of ODOT. The LOS standards of ODOT intersections are specified in Table 7 of the *Oregon Highway Plan* (Reference 4). Accordingly, the V/C ratio target for these intersections is 0.99 for the first and second hour during the two-hour peak operating conditions.

Existing Conditions

SITE CONDITIONS AND ADJACENT LAND USES

The approximately 11-acre site is located north of Blankenship Road and along the west site of Tannler Drive on land that is not currently developed. Adjacent land uses include office buildings to the west, commercial properties to the south, single-family residential buildings to the north, and a park to the east across Tannler Drive.

TRANSPORTATION FACILITIES

Table 1 identifies the characteristics of key streets located within the vicinity of the site. Figure 3 identifies the existing lane configurations and traffic control devices at the study intersections.

Bicycle and Pedestrian Facilities

The City's TSP identifies several bike and pedestrian projects near the project site. The identified projects include installing sidewalks on the north side of Blankenship Road, installing sidewalks along Tannler Drive from Blankenship Road to Greene Street, and installing two-way cycle tracks on the north side of Salamo Road from Tannler Drive to Barrington Drive. The two-way cycle track along Salamo Road has been completed. Tannler Drive and Blankenship Road in the proposed project area are also listed on the TSP's Trails Master Plan as on-street connection trails.

The development proposes a 12-foot-wide multiuse path along the west side of the realigned Tannler Drive. Near the realigned intersection with Blankenship Road, the multiuse path transitions into separate sidewalks and on-street bike lanes. These pedestrian and bicycle improvements are consistent with the project identified in the City's TSP. Eight-foot-wide sidewalks are proposed along the east side of the realigned Tannler Drive adjacent to the southeastern portion of the development. Additional sidewalk improvements are also proposed along the east side of the existing Tannler Drive alignment, extending north to the point where Tannler Drive realignment begins.

Transit Facilities

The proposed site is located near two pairs of transit stops that enable local and regional transit connections. At the intersection of Tannler Drive and Blankenship Road directly south of the site, access to TriMet line 153 is provided. Less than half a mile away south of the site at the intersection of 10th Street, 8th Avenue, and 8th Court, access is available to TriMet line 76. Further details on the two routes are provided below:

- TriMet Route 153 operates between West Linn and Lake Oswego. The route operates hourly between approximately 6AM and 5PM on weekdays.
- TriMet Route 76 operates between Oregon City and Beaverton. It is a frequent service route that operates between approximately 6AM and 11PM daily at 15-minute intervals for most of the day. The route offers broad regional connectivity via its connection to the TriMet MAX light rail system in Beaverton and the WES commuter rail in Tigard.

At the time this report was prepared, TriMet was evaluating significant changes in service levels, including the potential elimination of Route 153 and shortening Route 76 to extend only from Oregon City Transit Center to Meridian Park Hospital. We also note that TriMet's Forward Together Final report identifies further service reductions within West Linn over time.

Routes to Nearest Schools

According to both the West Linn-Wilsonville School District boundaries for the 2025-26 school year (Reference 5) and the proposed school boundaries for the 2026-27 school year (Reference 6), school-aged children of the proposed development would attend the Willamette Primary School, Athey Creek Middle School, and the West Linn High School. The Primary School is approximately 0.6 miles away, the Middle School is approximately 1.6 miles away and the high school is nearly 3 miles away. As such, the proposed development is located outside of the Walk Zones of all three schools, and busing would be available for students living in the proposed development.

TRAFFIC VOLUMES AND PEAK HOUR OPERATIONS ANALYSIS

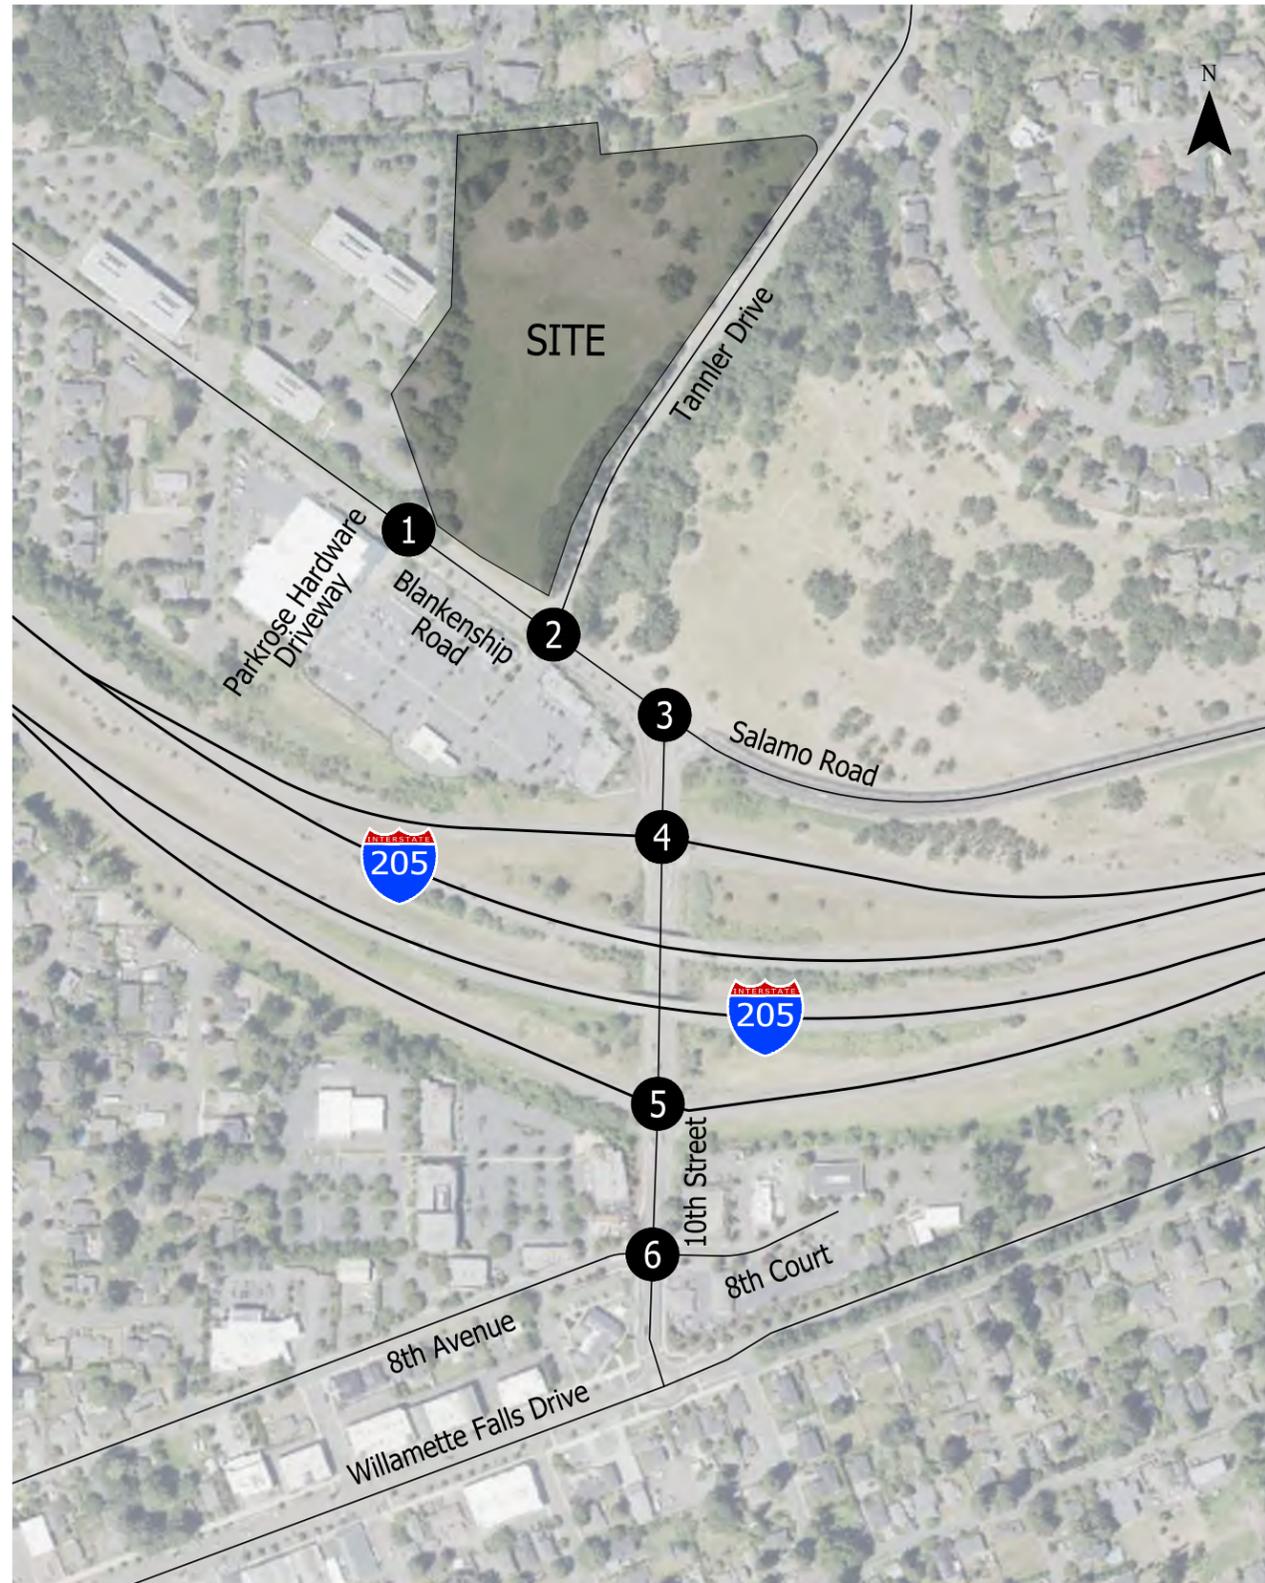

Vehicle turning movement, pedestrian and bicycle counts were collected at the study intersections. Counts were collected on a mid-week day in September 2025 for all study intersections except for study intersection #1. Counts at the Blankenship Road/Parkrose Hardware Driveway/Office Driveway intersection were collected on a mid-week day in December 2025 and adjusted to match the traffic volumes at the other remaining study intersections. All traffic counts were conducted during the weekday morning (7:00 AM - 9:00 AM) and evening (4:00 PM – 6:00 PM) hours and there were no adverse weather conditions. Local schools were in session at the times of the traffic counts.

On the day of the counts, the morning peak hour occurred from 7:40 AM – 8:40 AM at the I-205 ramp intersections (study intersections #4 and #5). The evening peak hour at these two intersections occurred from 4:55 PM – 5:55 PM. These AM and PM peak hours were analyzed at all the study intersections to evaluate operations and queues. Current traffic signal phasing and signal cycle length information for the signalized study intersections were obtained from ODOT, which operates the traffic signals. *Appendix B contains the traffic count worksheets.* Figure 4 and Figure 5 summarize the existing traffic conditions during the weekday AM and PM peak hours, respectively.

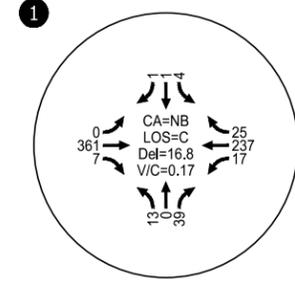

For the two City-owned intersections (study intersections #1 and #2), movement and approach delay, V/C, and delay were analyzed to understand compliance with the City's operational performance metrics. Table 2 and Table 3 show the delay, LOS, and V/C by movement and approach for study intersection #1 and #2 during the weekday AM and PM peak hours, respectively, under existing traffic conditions. The intersection operations at the two City of West Linn intersections meet the City's LOS "E" standard during the AM peak hour. During the PM peak hour, the northbound access point from the private Parkrose Hardware driveway and the southbound Tannler Drive approach each operate with delays corresponding to LOS F.

The intersection operations of the four ODOT intersections within the study area satisfy the mobility target during both the AM and PM peak hours (only the first peak hour was analyzed given the mobility targets were satisfied).

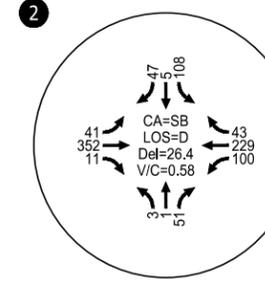

Existing conditions operations analysis worksheets are provided in Appendix C.

TRAFFIC SAFETY

The ODOT Crash Data System was queried to obtain crash records at the study intersections for the five-year period from January 1, 2019 to December 31, 2023 (the 2024 data provided by ODOT was deemed preliminary at the time this report was prepared so was not considered). The crash type classifications at each intersection with reported crashes were reviewed to assess whether crash patterns might be identifiable. Table 4 shows the reported crashes by type and severity. *Appendix D contains detailed crash summary worksheets.*

¹ PDO: Property Damage Only

As shown in Table 4, there were no reported crashes involving someone walking or riding a bike during the five years in which the data was available. No fatal crashes were reported. There was one major injury crash (classified by ODOT as Injury A) at Blankenship Road/Salamo Road/10th Street, as described below:

- On October 23, 2023, at the Blankenship Road/Salamo Road/10th Street intersection, a passenger car turning right from southbound direction to eastbound direction made an improper turn from the wrong lane at approximately midnight, colliding with the curb. The driver sustained incapacitating injuries. There were no passengers. The crash occurred under clear, dry conditions at night with streetlights.

Observed intersection crash rates were calculated and compared to statewide crash rate performance thresholds as shown in Table 5. The observed intersection crash rate was compared to the 90th percentile crash rates for urban intersections by traffic control and 3- versus 4-legged configurations (as appropriate) following the analysis methodology presented in the ODOT *Analysis Procedures Manual* (APM, Reference 7). Per the APM, intersections with observed crash rates that exceed the 90th percentile values shown in APM Exhibit 4-1 should be flagged for further analysis. As shown, all study intersection crash rates are below the 90th percentile crash rate.

¹ MEV = Million entering vehicles

The 2023 ODOT Safety Priority Index System (SPIS) was also reviewed to identify any intersections flagged within the top 10 to 15 percent in Region 1 based on crash rate, frequency, and severity. No study intersections were identified as SPIS locations in the 2023 report.

We also note that there were no clear trends in the crash patterns at the study intersections. Based on the above observations, no crash-related changes to the intersections are recommended.

INTERSECTION AND STOPPING SIGHT DISTANCE

Intersection sight distance documentation at the site access points and along the site frontage will be documented on the civil engineering plans provided through the site plan application process.

We recommend that on-site landscaping, signage, and any new above-ground utilities be appropriately located and maintained to provide adequate intersection sight distance per applicable City requirements.

Background Conditions

The background traffic conditions analysis identifies how the study intersections are projected to operate in the 2029 horizon year without the construction of the proposed development.

No in-process developments were identified during the scoping process with City and ODOT staff, and no funded transportation improvements have been identified at the study intersections that will be completed by the horizon year 2029.

We do note that the adopted City of West Linn TSP identifies the following projects within the site vicinity (none of which are currently funded for construction by 2029):

- The provision of continuous sidewalks on the northside of Blankenship Road and Salamo Road in areas where there are currently gaps (*Site frontage improvements along Blankenship Road will be completed as part of the new apartments and retail*).
- The provision of sidewalks on both sides of Tannler Drive north of Blankenship Road. (*Site frontage improvements along Blankenship Road will be completed as part of the new apartments and retail*).
- The installation of a two-way cycle track on the north side of Salamo Road from Tannler Drive to Barrington Drive.
- The widening of 10th Street between Blankenship/Salamo Road and Willamette Falls Drive to provide two travel lanes in each direction, continuous sidewalks and both sides of the street and enhanced bike facilities. Per the City's Capital Improvement Plan (2026 – 2031, Reference 8), construction of these improvements are partially funded in the year 2030 but the bulk of the costs are unfunded at this time.
- The realignment of Tannler Drive as a neighborhood route from its current intersection on Blankenship Road to a location opposite the Parkrose Hardware entry (*The realignment of Tannler Drive is being considered as part of this development proposal*).

TRAFFIC GROWTH ASSUMPTIONS

A two-percent annual growth rate was applied to the existing traffic volumes to reflect near-term growth for background traffic per City staff direction.

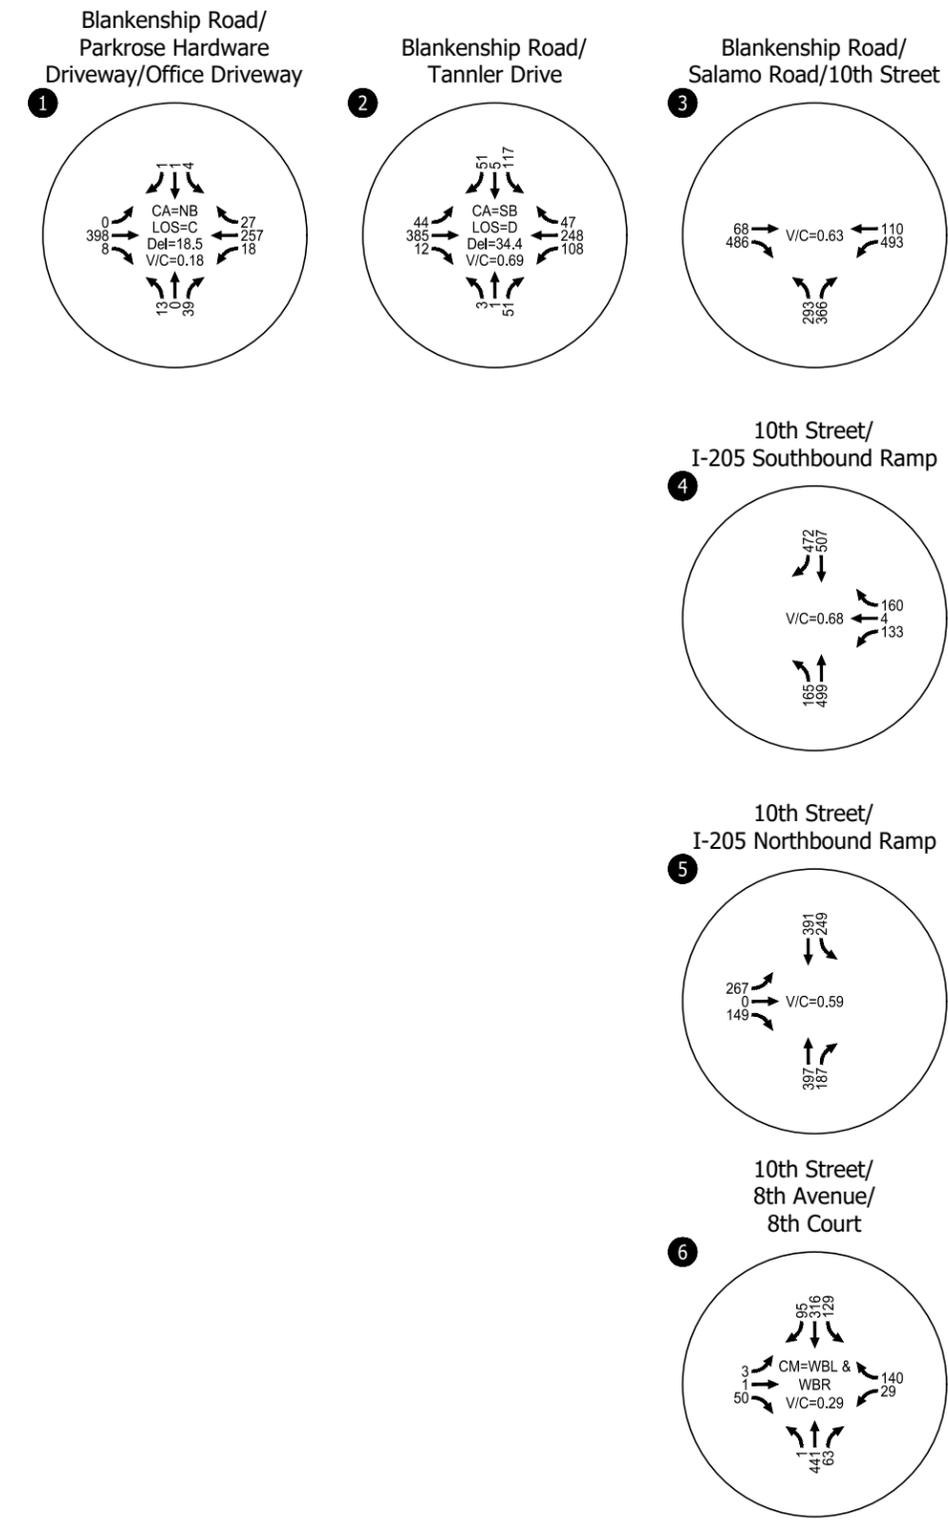

BACKGROUND TRAFFIC VOLUMES AND OPERATIONAL ANALYSIS

The 2025 weekday AM and PM peak hour existing traffic volumes along all public streets were increased with a two-percent annual growth rate to calculate the anticipated 2029 traffic volumes. The resultant year 2029 Background weekday AM and PM peak hour traffic volumes and intersection operations are shown in Figure 6 and Figure 7.

Table 6 and Table 7 show the delay, LOS, and V/C by movement and approach for the two City-owned intersections for the weekday AM and PM peak hours, respectively, under background growth traffic conditions. The intersection operations at the two intersections meet the City's LOS "E" mobility standard during the AM peak hour. During the PM peak hour, neither intersection meets the City's mobility standard. As noted in the existing conditions, during the PM peak hour, the northbound access point from the private Parkrose Hardware driveway and the southbound Tannler Drive approach operate with delays corresponding to LOS F. The background conditions at the two City intersections will be mitigated through a combination of the Tannler Drive realignment, turn lane improvements, and signalization proposed in conjunction with site developed as documented later in this report.

The intersection operations of the four ODOT intersections within the study area satisfy the mobility target during both the AM and PM peak hours.

Appendix E contains the year 2029 background traffic conditions worksheets.

Full Buildout Traffic Conditions

This section forecasts how the study intersections are anticipated to operate at the 2029 horizon year with the additional traffic associated with full construction and occupancy of the proposed development. Tannler Drive will be realigned opposite the existing Blakenship Road/Parkrose Hardware Drive/Office Drive intersection as part of the development, consistent with the City’s TSP.

As part of the proposed realignment, the existing Office Driveway on Blankenship Road aligned with the Parkrose Hardware Access will be relocated and tied into the new Tannler Drive alignment approximately 120 feet to the north. The reconfigured driveway for the Office will operate as a right-in/right-out access on Tannler Drive given its proximity to the new Tannler Drive intersection with Blankenship Road. Accordingly, existing traffic entering the Office Driveway was assumed to reroute in the full buildout traffic analysis to reflect this proposed driveway reconfiguration. In addition, the full buildout conditions assume the installation of a traffic signal at the realigned Tannler Drive/Blankenship Road intersection¹. Figure 8 illustrates the assumed future lane configurations and traffic control devices at the study intersections.

Appendix F shows the rerouted trips as part of the proposed Tannler Drive realignment, and office driveway access restriction.

TRIP GENERATION

Table 8 shows the trip generation estimates prepared for the proposed project based on the rates included in the *Trip Generation Manual, 12th Edition* (Reference 9), as published by the Institute of Transportation Engineers (ITE). The fitted curve equations (when available) were used for the housing and retail land uses, consistent with ITE methodology. Although industry practice would typically involve application of a pass-by rate for the retail trips to recognize retail customers currently driving past the site, the analysis assumes that all trips are new to the intersections in order to provide a more conservative estimation of potential operations at the intersections.

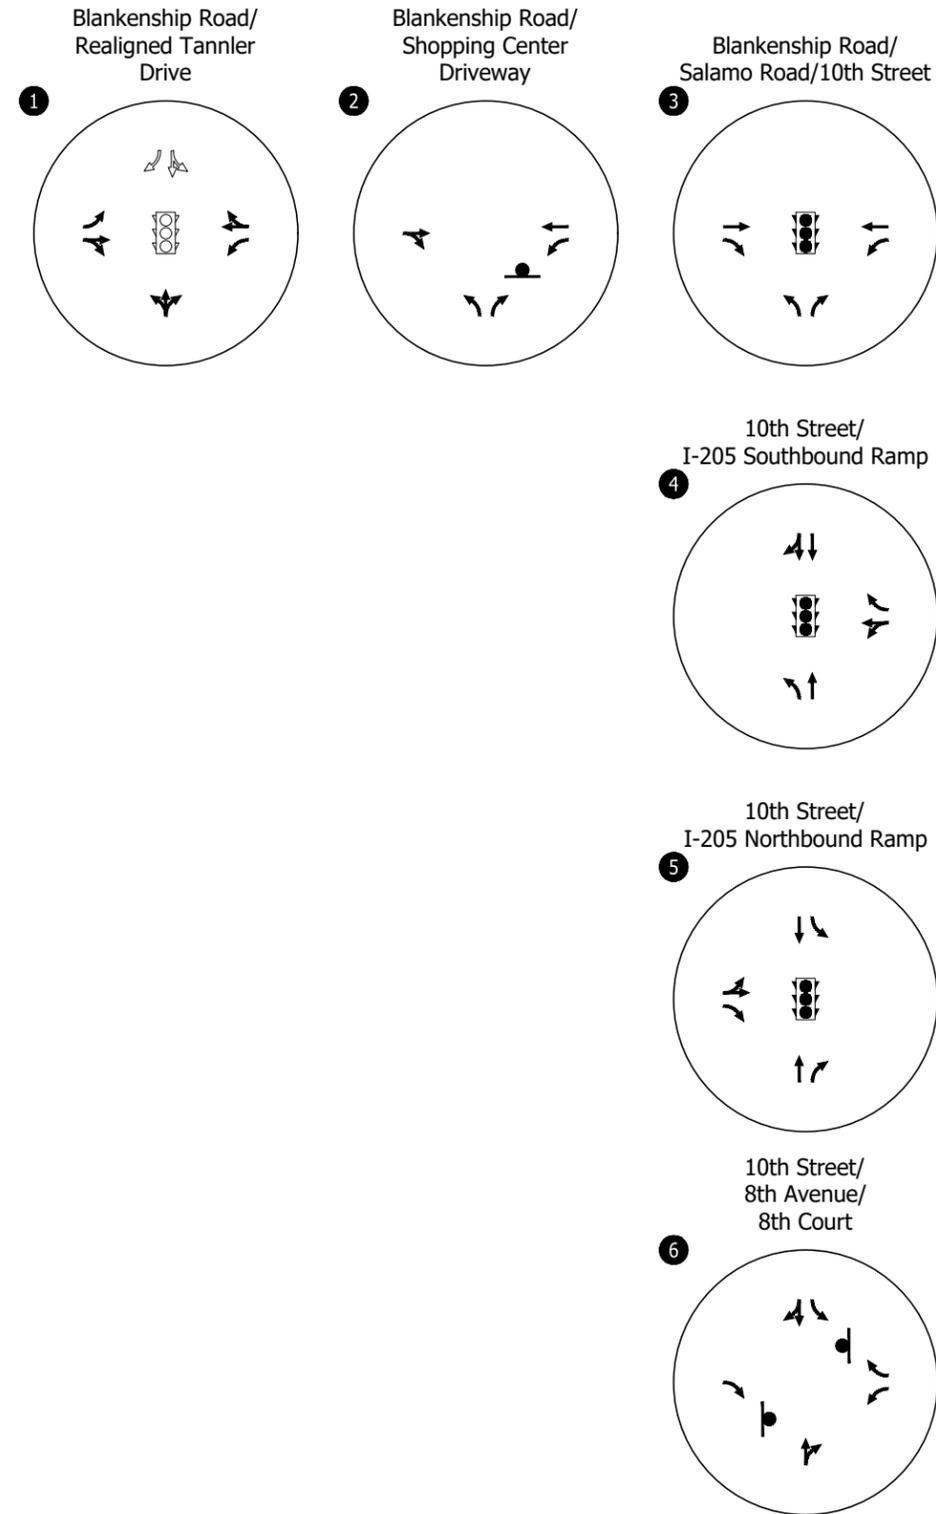

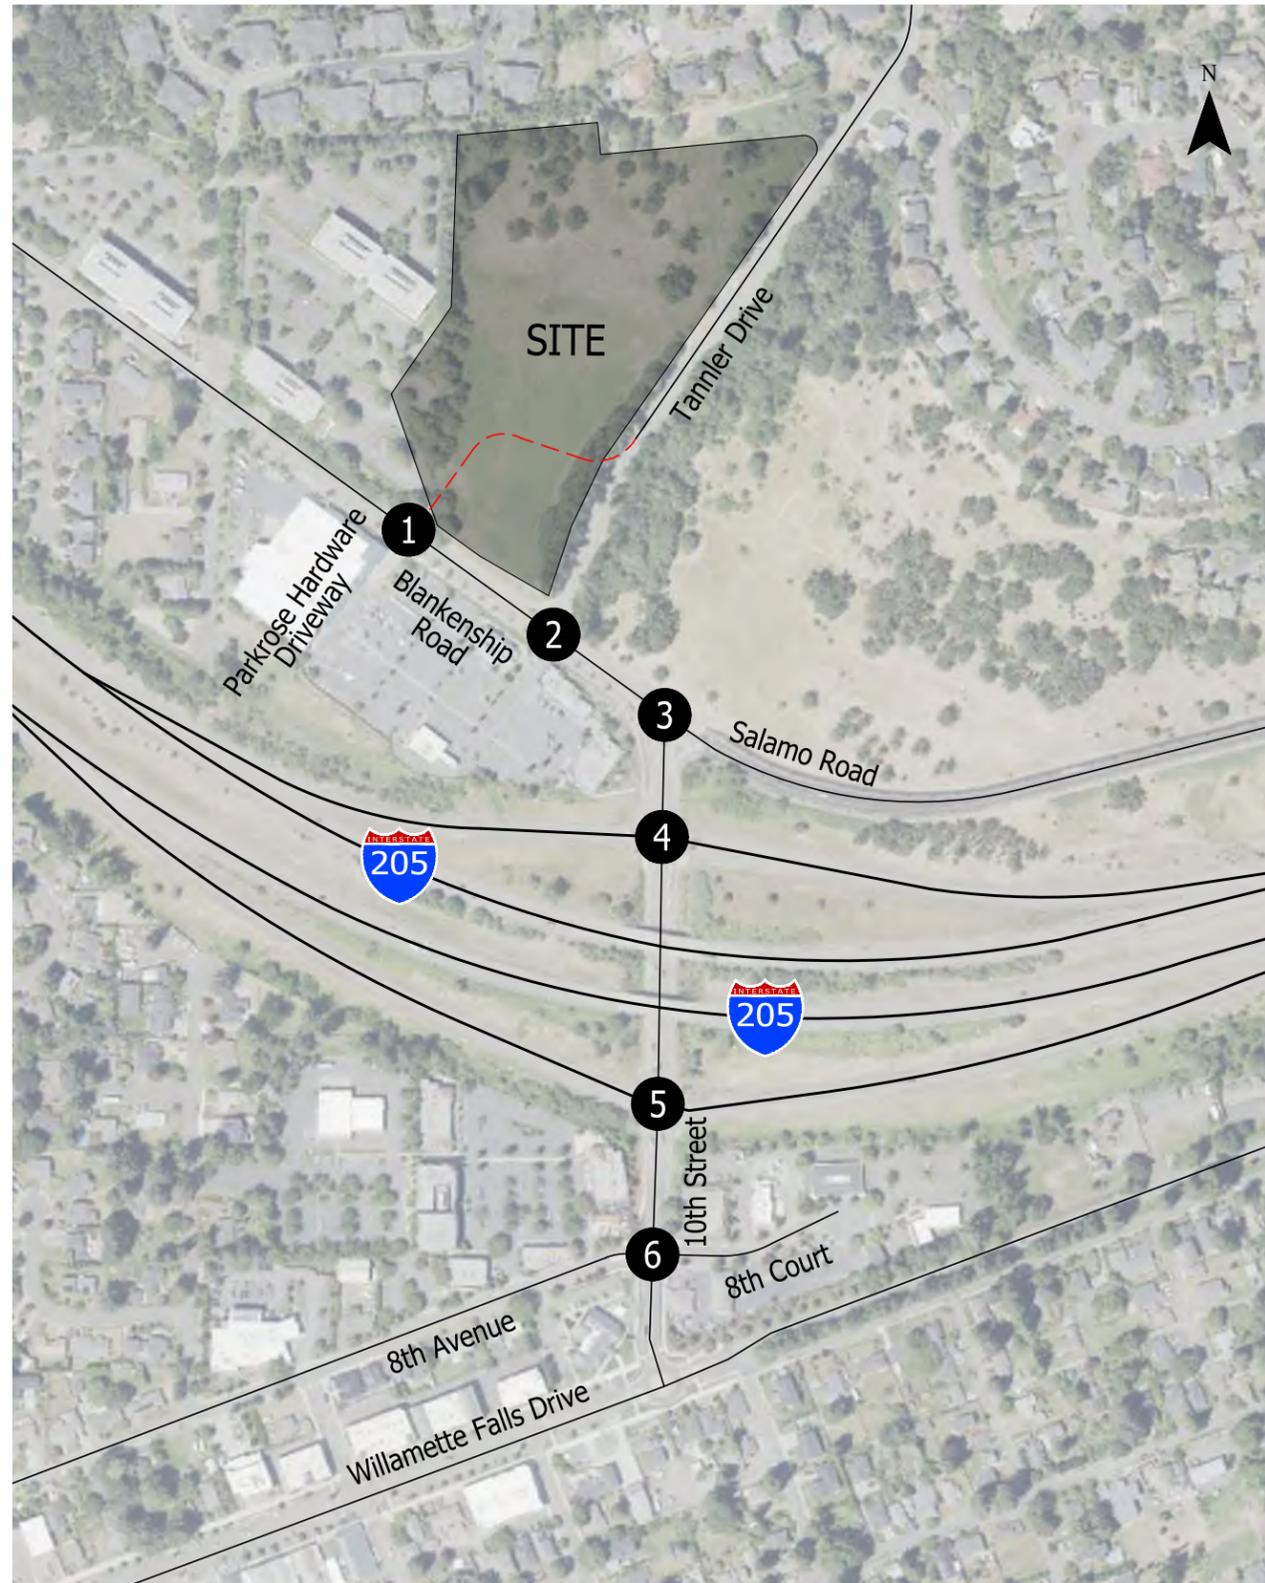

Table 8. Trip Generation Estimate

Total Site Trips			2,112	168	52	116	201	118	83

TRIP DISTRIBUTION

The distribution pattern for the site-generated trips during the weekday AM and PM peak hours shown in Table 8 is reflected Figure 9 and Figure 10 respectively.

¹ If the new intersection were to be operated with two-way stop-control, the peak hours delay and LOS would exceed City requirements and long queuing would result at the Tannler Drive southbound approach similar to the LOS F findings of the background traffic conditions analysis.

FULL BUILDOUT TRAFFIC VOLUMES AND INTERSECTION OPERATIONAL ANALYSIS

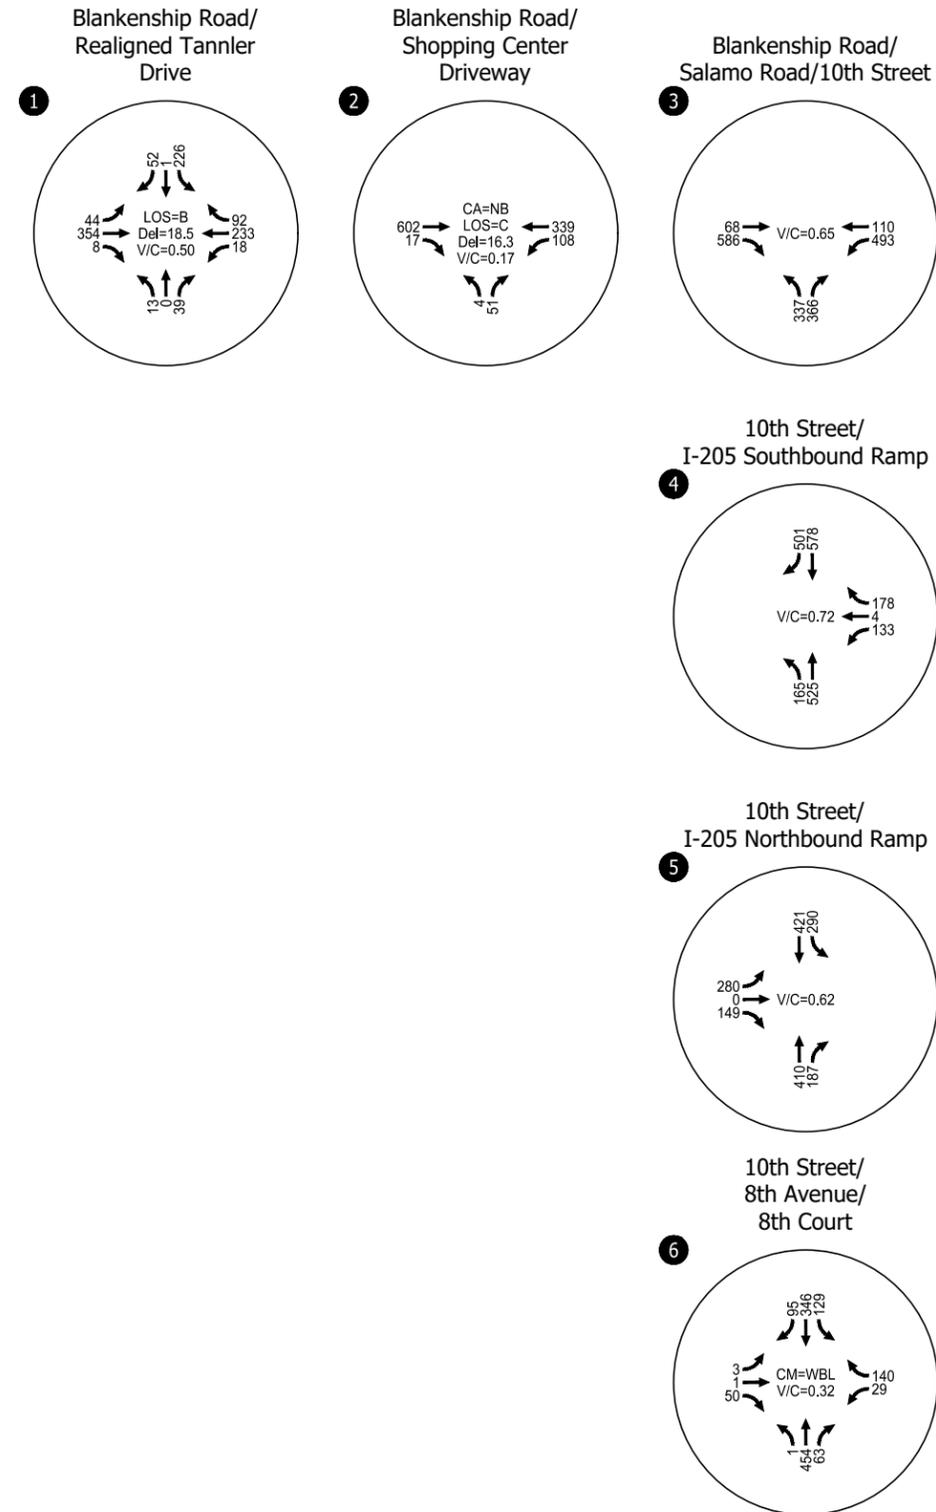

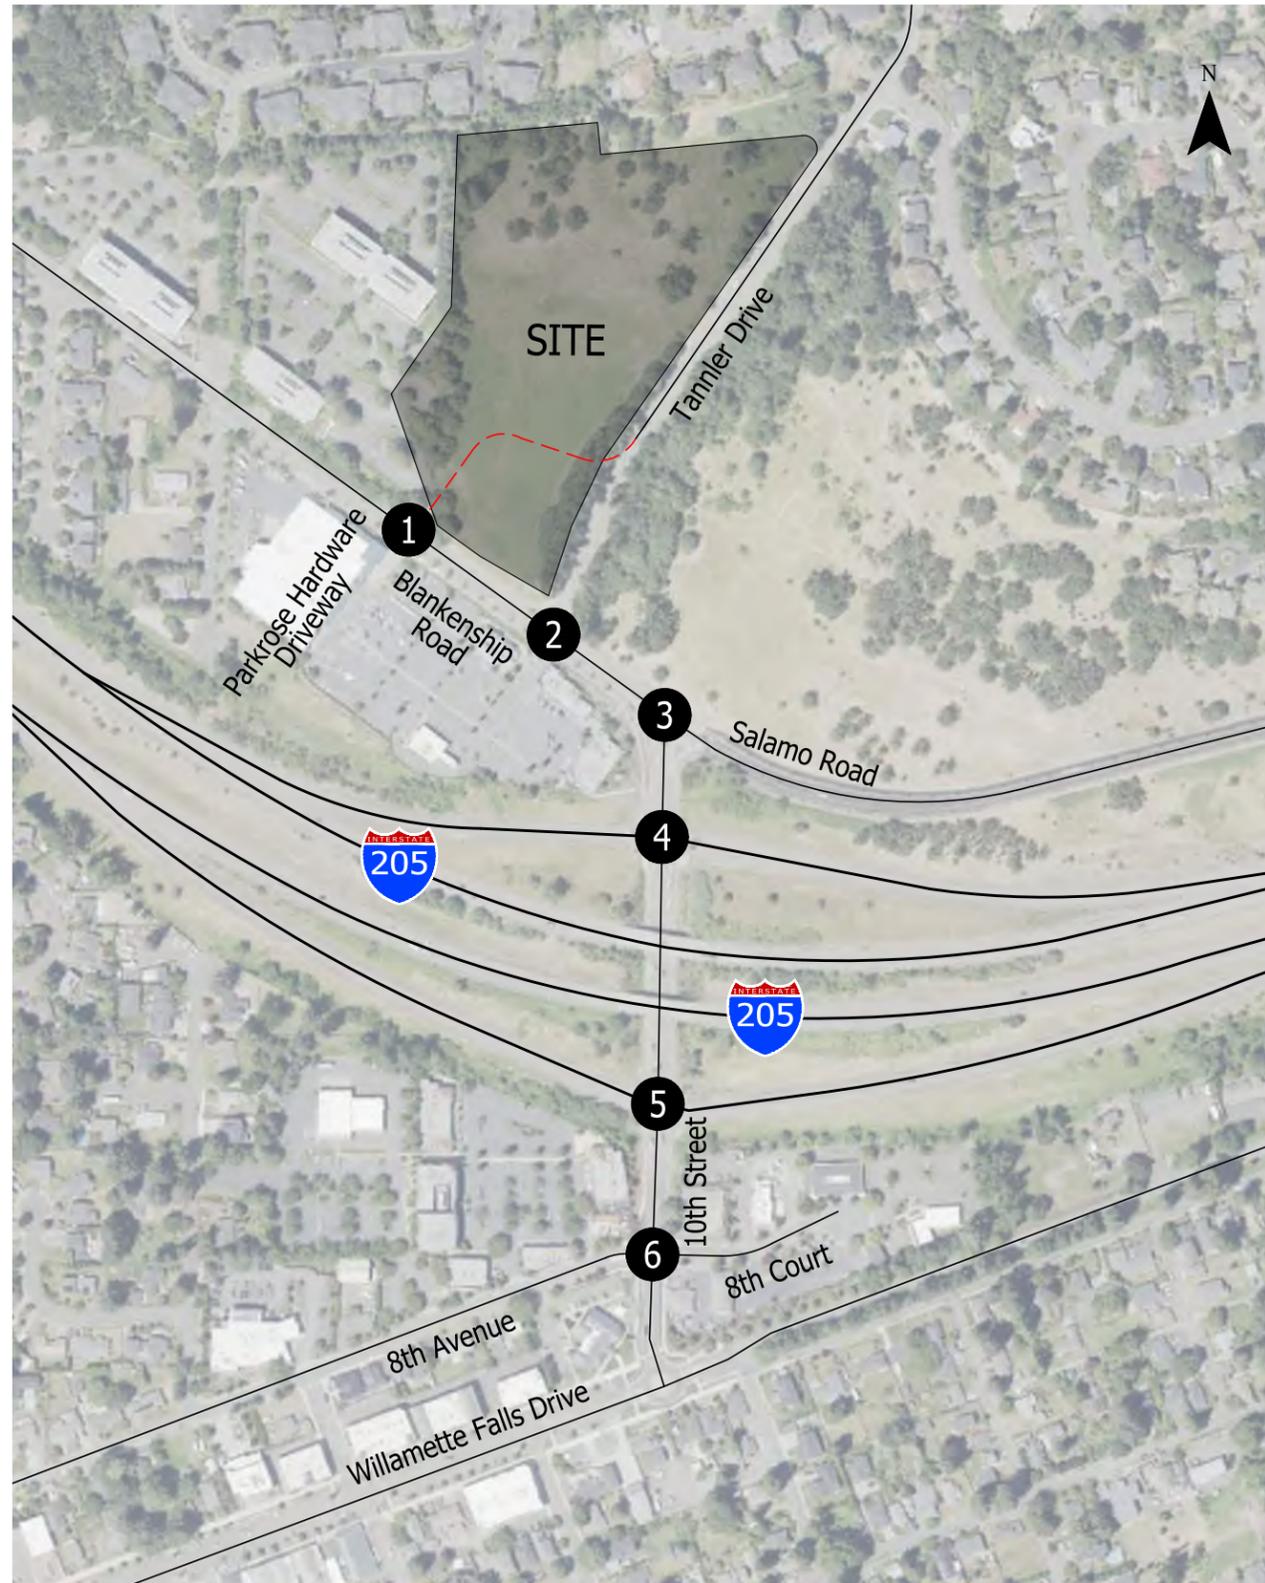

The full buildout traffic conditions analysis forecasts how the study intersections will operate with the traffic associated with full occupancy and operation of the proposed development. The site-generated trips shown in Figure 9 and Figure 10 were added to the 2029 background traffic volumes reflected in Figure 6 and Figure 7 to arrive at the 2029 full buildout traffic volumes shown in Figure 11 and Figure 12.

Figure 11 and Figure 12 also include the resulting intersection operations under full buildout traffic conditions. Table 9 and Table 10 show the delay, LOS, and V/C by movement and approach for the weekday AM and PM peak hours, respectively, under full buildout traffic conditions and assuming a traffic signal at the Blankenship Road/realigned Tannler Drive intersection.

The intersection operations of the four ODOT intersections within the study area satisfy the mobility target during both the AM and PM peak hours. With the proposed signal, the intersection operations at the Blankenship Road/realigned Tannler Drive intersection comply with City standards.

Following a realignment of Tannler Drive to the west, the existing two-way left turn lane along Blankenship Road can be extended to the Shopping Center Driveway (at Intersection 2). This change can allow drivers who are turning left out of the driveway onto Blankenship Road to make the northbound left-turn in two stages, queuing in the two-way left turn lane while awaiting a gap in the westbound through traffic. By providing two-stage gap maneuvers, the traffic operations for this northbound left movement improves from LOS "F" during the PM peak hour to LOS "D". We further note that the northbound left-turns at this unsignalized access will have alternative access available via the shopping center to the future signalized Blankenship Road/realigned Tannler Drive intersection.

Appendix G contains the year 2029 full buildout traffic analysis worksheets.

SITE CIRCULATION AND PARKING

Eight curb cuts are proposed along Tannler Drive to provide vehicle access to the proposed buildings. As shown in Figure 2, the four northern curb cuts form two on-site driveway loops that connect buildings and associated parking with Tannler Drive.

The existing Blankenship Road vehicle access to buildings within 205 Willamette Corporate Center will be relocated in conjunction with the Tannler Drive realignment. The new re-aligned office building access will connect to Tannler Drive approximately 120 feet north of Blankenship Road and is recommended to be limited to right-in-right-out access only at Tannler Drive due to its proximity to the Blankenship Road/realigned Tannler Drive intersection. The relocated driveway is anticipated to be blocked by 95th percentile queues southbound queues on Tannler Drive during both the weekday AM and PM peak hours². Full access to the parking lots within 205 Willamette Corporate Center will be maintained at the driveway along 13th Street (Summerlinn Drive), two blocks from the existing site access.

The City's TSP specifies access spacing standards for roads under its jurisdiction. Accordingly, private driveways need to be spaced 100 feet apart along neighborhood routes (i.e., Tannler Drive's classification). The City's Public Works Design Standards Section 5.0070 further requires that each driveway curb cut have a minimum width of 16 feet and a maximum width of 36 feet.

The proposed curb cuts are between 24 and 30 feet in width and are separated over 100 feet apart from each other and existing intersections. The proposed curb cuts and driveway locations meet City standards.

INTERSECTION AND SITE-ACCESS DRIVEWAY QUEUING ANALYSIS

A 95th-percentile queuing analysis was performed in Vistro for intersection #1 and #2, the two intersections that will be impacted directly by the proposed development.

Table 11 shows that the existing and future weekday AM and PM peak hour 95th-percentile queues can be accommodated assuming a peak 15-minute flow rate. Queues are rounded up to the nearest vehicle length. Each vehicle was assumed to occupy approximately 25 feet.

² The right-turn only recommendation is predicated on 1) the potential for southbound queues on Tannler Drive to routinely block the access that could in turn lead to northbound Tannler Drive vehicle queue spillback onto Blankenship Road due to the inability to accommodate northbound left-turns into the office property at all times and 2) intersection sight distance limitations for eastbound left-turns out of the office building associated with both the close proximity to Blankenship Road and southbound queues on Tannler Drive.

¹ The driveway is connected to the business parking lot which offers additional storage.

² Proposed distance to the full-access driveway. The driveway to access the existing office building along Tannler Drive (205 Willamette Corporate Center) is proposed to be configured and operation as a right-in-right-out driveway.

³ Movement shares a two-way left-turn lane with the Blankenship Road/Tannler Drive intersection.

⁴ Existing southbound approach at the Blankenship Road/Tannler Drive intersection features a shared left/through/right lane and has approximately 1,250 feet of storage. Field observation shows existing southbound right-turning vehicles utilizing the additional lane width near the intersection as a flared right-turn lane, similar to as if a separate right-turn lane is provided at the approach. The 95th percentile queue for southbound right-turning vehicles under existing and background conditions are therefore calculated separately from through or left-turning vehicles.

⁵ Movement shares a two-way left-turn lane with the Blankenship Road/Parkrose Hardware Driveway/Office Driveway intersection.

⁶ Northbound through movement is not possible in full buildout traffic conditions. In full buildout traffic conditions, only northbound left-turn movement is evaluated.

⁷ Westbound right-turn movement is not possible in full buildout traffic conditions. In full buildout traffic conditions, only westbound through movement is evaluated.

TRAFFIC SIGNAL WARRANT EVALUATION

The *Manual on Uniform Traffic Control Devices* (MUTCD, Reference 10) identifies nine warrants for traffic signal installation. Table 12 identifies the results of a preliminary traffic signal warrant analysis for each of the nine MUTCD signal warrants at the Blankenship Road/realigned Tannler Drive intersection assuming the development is fully occupied.

Table 12. MUTCD Signal Warrant Analyses

Warrant		Signal Warrant Met?	Assessment
#1	8-Hour Volume	No	This warrant is intended for application where a large volume of intersecting traffic is the principal reason to consider a traffic control signal.
#2	4-Hour Volume	Yes	This warrant is intended to be applied where the volume of intersecting traffic is the principal reason to consider installing a traffic control signal.
#3	Peak Hour	Not Applicable	This warrant is intended for use at a location where traffic conditions are such that for a minimum of 1 hour of an average day, the minor street traffic suffers undue delay when entering or crossing the major street. This signal warrant shall be applied only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time.
#4	Pedestrian Volume	No	This warrant is designed to be applied where pedestrians experience excessive delay trying to cross a street due to heavy traffic volumes. Pedestrian volumes alone are not expected to warrant signalization.
#5	School Crossing	Not Applicable	This warrant is designed to be applied at locations where school children are trying to cross a major street and there are not adequate gaps in the major street traffic stream. There is no school in close proximity to justify signalization.
#6	Coordinated Signal System	No	This warrant is intended to facilitate progressed traffic flow within a coordinated traffic signal system and allows for installation of traffic control signals at intersections where they would otherwise not be needed in order to maintain proper platooning of vehicles.
#7	Crash Experience	No	This warrant is intended for application where the severity and frequency of crashes are the principal reasons to consider traffic signal installation. The reported crash patterns did not identify a pattern of five or more crashes within a 12-month period that would warrant signalization.

Warrant		Signal Warrant Met?	Assessment
#8	Roadway Network	Not Applicable	This warrant involves installing a traffic signal at an intersection to encourage concentration and organization of traffic flow on a roadway network. The warrant requires the intersection of two or more major routes that serve as the principal roadway network for through traffic flow. The intersecting streets are neighborhood routes or collectors, so this warrant does not apply.
#9	Intersection Near a Grade Crossing	Not Applicable	This warrant is intended for use at a location where the proximity to the intersection of a railroad grade crossing on an intersection approach controlled by a STOP or YIELD sign is the principal reason to consider installing a traffic signal.

As shown, a signal is anticipated to be warranted at this intersection based on the MUTCD warrants upon buildout.

Appendix H details the preliminary signal warrant #1 and #2 analysis under the full buildout traffic conditions.

Conclusions and Recommendations

As discussed herein, the proposed uses can be constructed and occupied while maintaining acceptable operations at the study intersections and access points, assuming provision of the following recommendations in conjunction with site development (subject to City and ODOT approval).

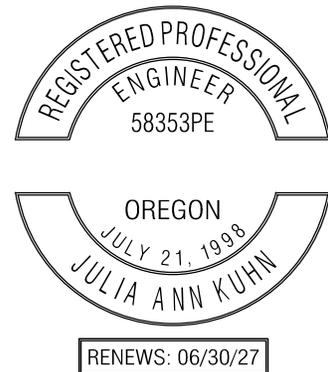

- Construct a southbound right-turn lane with at least 75 feet of storage and a separate shared through/left-turn lane on the proposed relocated Tannler Drive at its intersection with Blankenship Road.
- Construct a traffic signal at the relocated Blankenship Road/Tannler Drive intersection prior to the occupancy of the proposed homes.
- Place and maintain all vegetation, landscaping, and above ground objects adjacent to the site access points, local street intersections, along the public street site frontage, and throughout the site to provide adequate minimum sight distance in accordance with the City requirements.

RE: Tannler Drive Development Traffic Impact Analysis Scope – Updated with ODOT Comments

Mill Creek Residential Trust is proposing to develop approximately 320 apartments and 15,000 square feet of neighborhood retail space at the site located north of Blankenship Road along Tannler Drive. Site access is proposed via Blankenship Road and a realigned Tannler Drive.

Per the City of West Linn's Community Development Code (CDC) Section 85.170(B)(2)(d), a Traffic Impact Analysis (TIA) is required to support the development given the site trip generation exceeds 250 average daily trips.

The remainder of this memorandum summarizes the scope of the traffic impact analysis (TIA) to support the site uses. The memorandum includes the study area, estimated trip generation, estimated trip distribution pattern, and the proposed analysis methodology.

PROJECT DESCRIPTION

The development plan envisions up to 320 apartments with associated on-site amenities as well as 15,000 square feet of retail. Consistent with the City's Transportation System Plan (TSP), Tannler Drive will be realigned from its current intersection with Blankenship Road to a location approximately 350 feet to the west opposite the Parkrose Hardware access. Along the realigned Tannler Drive, six access points are proposed to serve the site. No access is proposed to Blankenship Road.

Full occupancy of the site is anticipated in February 2029. A preliminary site plan is provided in Appendix A.

TRIP GENERATION

Table 1 shows the trip generation estimates prepared for the proposed uses using the *Trip Generation Manual, 11th Edition*, as published by the Institute of Transportation Engineers (ITE). The fitted curve equations were used for the housing and retail land uses, consistent with ITE methodology. A 34 percent pass-by rate was assumed for the retail trips.

Table 1. Trip Generation Estimate

Net New Site Trips			2,050	154	45	109	194	110	84

TRIP DISTRIBUTION/ASSIGNMENT

Based on the location of employment and retail areas, the trips shown in Table 1 are expected to follow the estimated trip distribution pattern shown below:

- 15 percent to/from the north via Tannler Drive;
- 25 percent to/from the south via Tannler Drive and 10th Street;
- 35 percent to/from the east via Interstate 205; and,
- 25 percent to/from the west via Interstate 205.

STUDY INTERSECTIONS

The TIA study area, per CDC Section 85.170(B)(2)(d), need to include all points of access onto the public street system, all intersections of arterials, collectors, and neighborhoods routes within 1,000 linear feet from all points of access onto the public street system, and all intersections where the traffic generated by the proposed development exceeds five percent of existing AM or PM peak hour total intersection traffic volume.

In addition, Oregon Department of Transportation (ODOT) may require more analysis when intersections under its jurisdiction receive more than 50 peak hour trips as the result of a proposed land use action.

Accordingly, we propose to study the following locations:

- Blankenship Road/Tannler Drive;
- Blankenship Road/Salamo Road/10th Street;
- 10th Street/Interstate 205 Southbound Ramp;
- 10th Street/Interstate 205 Northbound Ramp; and,
- 10th Street/8th Avenue/8th Court.

TRAFFIC VOLUMES & ANALYSIS PERIODS

Traffic counts will be collected on in the fall 2025 on a typical weekday when schools are in-session during the weekday AM (7 – 9 AM) and PM (4 – 6 PM) peak hours. We will assess existing year 2025, future year 2029 background, and future year 2029 total intersection operations during weekday AM and PM peak hours.

INTERSECTION PERFORMANCE METRICS

Per the City's Public Works Design Standards (PWDS) Section 5.0014(G), The City of West Linn requires all intersections within the study area to maintain an acceptable level of service (LOS) upon buildout of the proposed land use action. The minimum acceptable LOS for signalized intersections is "D" or better for the intersection as a whole. No approach should operate at worse than LOS "E", and a volume-to-capacity (V/C) ratio not higher than 1.0 is required for the sum of critical movements. The minimum acceptable LOS for non-signalized intersections is "E" or better for the poorest operating approach. No movement serving more than 20 peak hour vehicles should operate at worse than LOS "E". LOS "F" will be tolerated for minor movements during a peak hour.

Several of the proposed intersections are under the jurisdiction of the Oregon Department of Transportation (ODOT). The LOS standards of ODOT intersections are specified in the Oregon Highway Plan. Accordingly, the V/C ratio target is 0.99 for the first as well as the second hour during the two-hour peak operating conditions.

BACKGROUND AND IN-PROCESS DEVELOPMENTS

We propose applying a two-percent annual background growth rate to the 2025 volumes to account for general regional growth through 2029. Would you please provide us with any in-process developments to include in our study?

SAFETY

We will obtain and review the most recent five-year crash records at the existing study intersections from ODOT. Using the ODOT data, we will calculate intersection crash rates and compare them to statewide crash rate performance thresholds. For this analysis, the critical crash rate will be calculated and compared to the 90th percentile crash rates.

MULTIMODAL FACILITIES

We will document the availability of pedestrian and bicycle facilities as well as the adjacent transit service.

We note that the City's TSP identifies several bike and pedestrian projects near the project site. The projects include installing sidewalks on the north side of Blankenship Road, installing sidewalks along Tannler Drive up to Greene Street, and installing two-way cycle tracks on the north side of Salamo Road from Tannler Drive to Barrington Drive. Tannler Drive and Blankenship Road in the proposed project area are also listed on the TSP's Trails Master Plan as on-street connection trails.

INTERSECTION GEOMETRY AND LANE CONFIGURATION EVALUATION

As part of the TIA, we will evaluate the traffic control and lane geometry needs at the realigned Tannler Drive/Blankenship Road intersection.

TIA SCOPE

Per PWDS 5.0014(C), the TIA will include following items:

- Table of Contents
- Executive Summary
- Introduction and Description of Proposed Development
- Existing Conditions (2025)
- Background Conditions (2029)
- Full Buildout Traffic Conditions, Impacts, and Mitigation (2029)
- Conclusions and Recommendations
- Appendices

NEXT STEPS

We trust this memorandum provides adequate documentation of the key assumptions associated with the TIA for the proposed Mill Creek development. We look forward to working with you on this project.
