1.0 INTRODUCTION

1.1 Purpose of Study

Upgrades to Cedaroak Park Primary School are proposed to expand and improve the existing parking facilities and storm water infrastructure. A study was performed to evaluate the impacts of the proposed construction on existing stormwater characteristics, and to analyze the measures proposed to mitigate those impacts. This report presents the information, methods, and results generated from that study.

1.2 Project Location

The proposed project is located in Clackamas County, Oregon in the City of West Linn. The site is located at 4515 Cedaroak Drive.

1.3 Project Description

The West Linn Wilsonville School District proposes to demolish and rebuild the existing parking lot on the north side of the site and install storm drain infrastructure to alleviate historic drainage problems on the site. The proposed parking lot improvements are intended to provide improved traffic circulation and additional parking spaces for future building expansion.

1.4 Methodologies and Assumptions

The methodologies used in conducting the hydrologic and hydraulic analyses were generated from a variety of sources including existing maps, field data, nomographs, charts, computer programs, standards, and reference manuals.

The hydrologic analysis was performed using the Santa Barbara Urban Hydrograph method with an NRCS Type IA synthetic rainfall distribution. The calculations were executed with the computer program Bently PondPack 10.0. This method was used to generate site runoff hydrographs, determine peak flows, and perform pond routing analysis.

The hydraulic analysis for open channel pipe flow was performed using the Manning equation.

The inlet capacity analysis performed is based on the methods presented in the FHWA Urban Drainage Design Manual (HEC No. 22, August 2001).

1.5 Agency Stormwater Criteria

This project lies within the jurisdiction of the City of West Linn, which has the following policy regarding stormwater management for new construction.

Quantity Control: The City of West Linn Design Standards (Section Two) defines the criteria for stormwater quantity management. Onsite detention is required to provide quantity control for surface runoff to account for the increase in runoff due to land use changes associated with development. It is required that detention facilities be designed to provide storage for up to the 25-year storm event with the safe overflow conveyance of the 100-year storm event. Allowable post-development peak discharge rates for the 2, 5, 10, and 25-year events are limited to that of the pre-development discharge rates.

Quality Control: The City of West Linn uses the City of Portland Stormwater Management Manual for stormwater quality criteria, which defines the water quality design storm as a NRCS Type 1A rainfall distribution with 0.83" of rainfall over a 24 hour period.

Conveyance Piping: The City of West Linn Design Standards (Section Two) defines the criteria for conveyance piping, which shall be designed to convey the runoff from the 100-year storm event.

2.0 EXISTING DRAINAGE CONDITIONS

2.1 Description of Existing Drainage Conditions

The storm runoff collected at Cedaroak Park Primary School is currently discharged into various drywells around the campus. The parking lot runoff is collected by catch basins that are conveyed by underground pipe to drywells. The school has historically experienced excessive ponding during storm events which is likely the result of the inability of the existing drywells to function efficiently due to low soil infiltration rates. The ponding is concentrated mostly in the parking lots and courtyard areas of the school.

The FEMA Flood Insurance Rate Map Number 41005C 0019 D (Figure 1) shows that the project site is located within Other Areas - Zone X, which is described as "areas determined to be outside the 0.2% annual chance floodplain".

2.2 Hydrologic Analysis of Existing Conditions

A hydrologic analysis of the site in its pre-developed condition was performed as part of this study; the calculations are contained in Appendix B. The limits of that area considered as part of this study are shown on Figure 2. The hydrologic analysis was performed using the Santa Barbara Urban Hydrograph method with an NRCS Type IA synthetic rainfall distribution. The 24-hour rainfall depths were obtained from the City of Portland Stormwater Management Manual and are summarized in Table 1 below. Based on the relatively small area of the site, a time of concentration of 10 minutes was assumed. A runoff curve number (CN) of 76 was determined to be appropriate for the pre-developed site based on a Hydrologic Soil Group of C (Appendix A) and a woods cover type in fair hydrologic condition (NRCS TR-55, June 1986, see Appendix B). The runoff hydrographs for the various design storms are shown in Appendix B, and the calculated peak runoff rates are summarized in Table 2.

Design Storm	24-Hour Rainfall
2-Year	2.40"
5-Year	2.90"
10-Year	3.40"
25-Year	3.90"
100-Year	4.40"

Table 1: 24-Hour Rainfall Depths (Source: City of Portland Stormwater Management Manual)

Design Storm	Peak Runoff
2-Year	0.16 cfs
5-Year	0.28 cfs
10-Year	0.43 cfs
25-Year	0.59 cfs
100-Year	0.77 cfs

Table 2: Peak Runoff Rates for Existing Conditions

3.0 PROPOSED DRAINAGE CONDITIONS
3.1 Description of Proposed Drainage Conditions

The proposed drainage design includes curbs, drains, and piping to collect and convey the runoff from the parking lots and a portion the roof areas to underground detention piping. Detention piping will consist of 36" HDPE pipe, and discharge will be controlled by an orifice and riser combination outlet structure contained within a manhole (Figure 3). The detention piping will discharge to an existing drainage channel along the western edge of the property.

3.2 Hydrologic Analysis of Proposed Conditions

A hydrologic analysis of the site in the proposed condition was performed as part of this study; the calculations are contained in Appendix C. The hydrologic analysis was performed using the Santa Barbara Urban Hydrograph method with an NRCS Type IA synthetic rainfall distribution. The 24-hour rainfall depths were obtained from the City of Portland Stormwater Management Manual and are summarized in Table 1 in Section 2.2. Based on the small sizes of the sub-basins, a time of concentration of 10 minutes was assumed. A composite runoff curve number (CN) of 92 was calculated for the proposed conditions and is shown in Appendix C. The calculated peak runoff rates for each sub-basin for various design storms are summarized in Table 3, and the runoff hydrographs for all sub-basins combined are shown in Appendix C.

Sub-Basin	Peak Runoff (cfs)				
	2-Year	5-Year	10-Year	25-Year	100-Year
Prop-A	0.27	0.35	0.43	0.51	0.59
Prop-B	0.20	0.27	0.34	0.41	0.48
Prop-C	0.19	0.25	0.31	0.37	0.43

Table 3: Peak Runoff Rates for Proposed Conditions

The proposed detention pipe was designed as 650 feet of 36" pipe with a 0.25% slope. The detention pipe was designed to store the runoff from a 24-hour storm with recurrence intervals of 2, 5, 10, and 25-years while not releasing a peak rate greater than the peak rate leaving the site under a pre-developed condition for the same storms. The detention system performance for each storm event is summarized by graphs in Appendix C. The 100-year storm event will be conveyed through the outlet structure and underground piping to the discharge point for the system.

The detention pipe outlet structure was designed as an orifice with an elevated riser. The orifice diameter was sized to be 2" (0.17') with its invert equal to the downstream invert of the detention pipe. The riser was designed as a 12" diameter standpipe with a crest elevation 3.9' above the orifice invert – see Figure 3 for detail.

3.3 Hydraulic Analysis of Proposed Conditions

The proposed drainage infrastructure was analyzed hydraulically as part of this analysis and is included in Appendix D. All inlets have sufficient capacity to accept more than the peak runoff from a 100-year design storm with minimal ponding. All conveyance piping has the capacity to convey the peak runoff from a 100-year storm event.

3.4 Stormwater Quality Management

Stormwater quality for the north parking area will be provided by a bioswale. The bioswale has been designed in accordance with the City of Portland Stormwater Management Manual using the Presumptive Approach Calculator Ver 1.0 provided by the City of Portland Bureau of Environmental Services (BES). The calculations for the bioswale sizing are included in Appendix E.

4.0 SUMMARY

The increase in stormwater runoff due to the modifications in land use from the pre-developed condition to the proposed condition will be managed by detention piping and an outlet structure that will restrict the peak rate at which runoff from the proposed site will be discharged to an existing drainage channel. In addition, runoff from north parking lot will be treated for water quality prior to entering the detention system and being released to the existing drainage channel.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

		Good	30 ^{4/}	55	70	77
Farmsteads—buildings, lanes, driveways, and surrounding lots.		—	59	74	82	86

¹ Average runoff condition, and $I_a = 0.2S$.

² *Poor*: <50% ground cover or heavily grazed with no mulch.

Fair: 50 to 75% ground cover and not heavily grazed.

Good: > 75% ground cover and lightly or only occasionally grazed.

³ *Poor*: <50% ground cover.

Fair: 50 to 75% ground cover.

Good: >75% ground cover.

⁴ Actual curve number is less than 30; use CN = 30 for runoff computations.

⁵ CN's shown were computed for areas with 50% woods and 50% grass (pasture) cover. Other combinations of conditions may be computed from the CN's for woods and pasture.

⁶ *Poor*: Forest litter, small trees, and brush are destroyed by heavy grazing or regular burning.

Fair: Woods are grazed but not burned, and some forest litter covers the soil.

Good: Woods are protected from grazing, and litter and brush adequately cover the soil.

Appendix C

Calculations for Hydrologic Analysis of
Proposed Conditions

PROPOSED CONDITIONS**Table 2-2a** Runoff curve numbers for urban areas ^{1/}

Cover description	Average percent impervious area ^{2/}	Curve numbers for hydrologic soil group			
		A	B	C	D
<i>Fully developed urban areas (vegetation established)</i>					
LANDSCAPE AREAS					
Open space (lawns, parks, golf courses, cemeteries, etc.) ^{3/} :					
Poor condition (grass cover < 50%)		68	79	86	89
Fair condition (grass cover 50% to 75%)		49	69	79	84
Good condition (grass cover > 75%)		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)		98	98	98	98
Paved; open ditches (including right-of-way)		83	89	92	93
Gravel (including right-of-way)		76	85	89	91
Dirt (including right-of-way)		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only) ^{4/}		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)		96	96	96	96
Urban districts:					
Commercial and business	85	89	92	94	95
Industrial	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)	65	77	85	90	92
1/4 acre	38	61	75	83	87
1/3 acre	30	57	72	81	86
1/2 acre	25	54	70	80	85
1 acre	20	51	68	79	84
2 acres	12	46	65	77	82
<i>Developing urban areas</i>					
Newly graded areas (pervious areas only, no vegetation) ^{5/}		77	86	91	94
Idle lands (CN's are determined using cover types similar to those in table 2-2c).					

¹ Average runoff condition, and $I_a = 0.2S$.² The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition. CN's for other combinations of conditions may be computed using figure 2-3 or 2-4.³ CN's shown are equivalent to those of pasture. Composite CN's may be computed for other combinations of open space cover type.⁴ Composite CN's for natural desert landscaping should be computed using figures 2-3 or 2-4 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.⁵ Composite CN's to use for the design of temporary measures during grading and construction should be computed using figure 2-3 or 2-4 based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

CEDAROAK PARK PRIMARY SCHOOL
 Sub-Basin Summary for Proposed Conditions

Curve Number (CN) Impervious Areas: 98
 Curve Number (CN) Open Space Areas: 74
 Hydrologic Soil Group (HSG): C

Sub-Basin	Land Use	Area (ft ²)	Area (ac)	Percent Impervious	Composite CN	Time of Concentration, T _c (min)
Prop-A	Impervious/Landscaped	29,170	0.67	80%	93	10
Prop-B	Impervious/Landscaped	26,000	0.60	68%	90	10
Prop-C	Impervious/Landscaped	21,610	0.50	75%	92	10
Total:			1.76		92

Appendix D

Calculations for Hydraulic Analysis of
Proposed Conditions

INLET CAPACITY FOR SUMP INLET AT SUB-BASIN PROP-A

CHART 9B

Grate Inlet Capacity in Sump Conditions - English Units

$Q_{100} = 0.59 \text{ CFS (SUB-BASIN PROP-A), USE 1 CFS (MINIMUM VALUE ON CHART)}$

ASSUME WEIR FLOW CONTROLS

$P = 2(W + L) \text{ (FOR 50\% CLOGGING, ASSUME L IS HALF OF ACTUAL DIMENSION)}$

$P = 2*(2.0' + (0.5)*(2.0')) = 6.0 \text{ FT}$

CONCLUSION: MAX. PONDING DEPTH IS 0.16' FOR FLOW THAT IS GREATER THAN THE RUNOFF FROM A 100-YEAR STORM EVENT. INLETS HAVE SUFFICIENT CAPACITY.

12" HDPE Detention Outlet Pipe

Project Description

Friction Method Manning Formula
Solve For Normal Depth

Input Data

Roughness Coefficient	0.012
Channel Slope	0.02900 ft/ft
Normal Depth	0.33 ft
Diameter	1.00 ft
Discharge	1.52 ft ³ /s

Catchment Data

Catchment ID: **A**

Project Name: **Cedar Oak Park School**

Date: **03/16/09**

Project Address: **4515 Cedar Oak Drive**
West Linn, OR

Permit Number: **[Permit #]**

Designer: **STS**

Run Time: **3/16/2009 10:46:59 AM**

Company: **Winzler & Kelly**

Drainage Catchment Information

Catchment ID	A	
Catchment Area		
Impervious Area	17,000	SF
Impervious Area	0.39	ac
Impervious Area Curve Number, CN_{imp}	98	
Time of Concentration, T_c , minutes	5	min.

Site Soils & Infiltration Testing Data

Infiltration Testing Procedure:	Open Pit Falling Head	
Native Soil Field Tested Infiltration Rate (I_{test}):	0.1	in/hr
Bottom of Facility Meets Required Separation From High Groundwater Per BES SWMM Section 1.4:	Yes	

Correction Factor Component

CF_{test} (ranges from 1 to 3)	2
----------------------------------	----------

Design Infiltration Rates

I_{dsgn} for Native (I_{test} / CF_{test}):	0.05	in/hr	Design infiltration rate < 0.5 in/hr
I_{dsgn} for Imported Growing Medium:	2.00	in/hr

SWALE, PLANTER OR BASIN

Run Time 3/16/2009 11:36:06 AM

Project Name: Cedar Oak Park School

Catchment ID: A

Date: 3/16/2009

Catchment facility will meet Hierarchy Category: 3

Goal Summary:

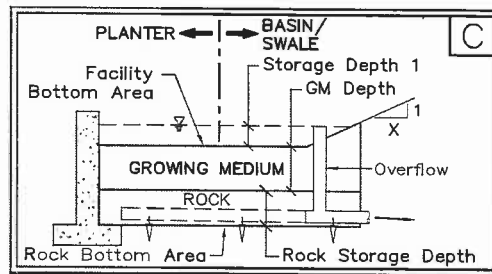

Hierarchy Category	SWMM Requirement	RESULTS box below needs to display...		Facility configurations allowed
		Pollution Reduction as a	10-yr (aka disposal) as a	
3	Off-site flow to drainageway, river, or storm-only pipe system.	PASS	N/A	ALL

Facility Type = Swale

Facility Configuration: C

Refer to Swale Worksheet and enter Swale Parameters

DATA FOR ABOVE GRADE STORAGE COMPONENT

Infiltration Area = 336 sf
 Surface Capacity Volume = 141.1 cf

Growing Medium Depth = 18 in
 Freeboard Depth = N/A in

Surface Capacity at Depth 1 = 141 cf
 GM Design Infiltration Rate = 2.00 in/hr
 Infiltration Capacity = 0.016 cfs

BELOW GRADE STORAGE

Rock Storage Capacity = _____ cf
 Native Design Infiltration Rate = _____ in/hr
 Infiltration Capacity = _____ cfs

RESULTS		Overflow Volume		Run PAC	
Pollution Reduction	PASS	0 CF	<u>88%</u> Surf. Cap. Used		
Output File					
Peak cfs	<u>2-yr</u> 0.240	<u>5-yr</u> 0.293	<u>10-yr</u> 0.346	<u>25-yr</u> 0.399	

FACILITY FACTS	
Total Facility Area Including Freeboard =	480 SF
Sizing Ratio (Total Facility Area / Catchment Area) =	0.028
