#### **COMMON TERMS**

Access Management: Refers to measures regulating access to streets, roads and highways from public roads and private driveways. Measures may include but are not limited to restrictions on the type and amount of access to roadways, and use of physical controls such as signals and channelization including raised medians, to reduce impacts of approach road traffic on the main facility.

*Accessway*: Refers to a walkway that provides pedestrian and or bicycle passage either between streets or from a street to a building or other destination such as a school, park, or transit stop.

*ADT*: Average Daily Traffic. This is the measurement of the average number of vehicles passing a certain point each day on a highway, road or street.

Alternative Modes: Transportation alternatives other than single-occupant automobiles such as rail, transit, bicycles and walking.

Arterial (Street): A street designated in the functional class system as providing the highest amount of connectivity and mostly uninterrupted traffic flow through an urban area.

Bicycle Facility: Any facility provided for the benefit of bicycle travel, including bikeways and parking facilities.

*Bicycle Network*: A system of connected bikeways that provide access to and from local and regional destinations.

*Bike Boulevard:* Lower-order, lower-volume streets with various treatments to promote safe and convenient bicycle travel. Usually accommodate bicyclists and motorists in the same travel lanes, often with no specific vehicle or bicycle lane delineation. Assign higher priority to through bicyclists, with secondary priority assigned to motorists. Also include treatments to slow vehicle traffic to enhance the bicycling environment.

Bike Lane: Area within street right-of-way designated specifically for bicycle use

*Capacity*: The maximum number of vehicles or individuals that can traverse a given segment of a transportation facility with prevailing roadway and traffic conditions.

*CBD*: Central Business District. This is the traditional downtown area, and is usually characterized by slow traffic speeds, on street parking and a compact grid system.

*Collector (Street)*: A street designated in the functional class system that provides connectivity between local and neighborhood streets with the arterial streets serving the urban area. Usually shorter in distance than arterials, designed with lower traffic speeds and has more traffic control devises than the arterial classification.

Congestion Mitigation/Air Quality (CMAQ): A program within the federal ISTEA and TEA-21 regulations that address congestion and transportation-related air pollution.

*Crosswalk*: Portion of a roadway designated for pedestrian crossing and can be either marked or unmarked. Unmarked crosswalks are the national extension of the shoulder, curb line or sidewalk.

*Demand Management*: Refers to actions which are designed to change travel behavior in order to improve performance of transportation facilities and to reduce need for additional road capacity. Methods may include

West Linn Transportation System Plan Technical Appendix

subsidizing transit for the journey to work trip, charging for parking, starting a van or car pool system, or instituting flexible work hours.

*Employee Commute Options (ECO):* rules that were passed by the Oregon Legislature in 1993 (and revised in February 2007) to help protect the health of Portland area residents from air pollution and to ensure that the area complied with the Federal Clean Air Act

*Grade Separation*: The vertical separation of conflicting travelways.

*Grade*: A measure of the steepness of a roadway, bikeway or walkway, usually expressed in a percentage form of the ratio between vertical rise to horizontal distance. (eg. a 5% grade means that the facility rises 5 feet in height over a 100 feet in length.)

High Occupancy Vehicle (HOV): A vehicle containing two or more occupants, generally a driver and one or more passengers.

*Impervious Surfaces*: Hard surfaces that do not allow water to soak into the ground, increasing the amount of stormwater running into the drainage system.

Intelligent Transportation Systems (ITS): the application of advanced technologies and proven management techniques to relieve congestion, enhance safety, provide services to travelers and assist transportation system operators in implementing suitable traffic management strategies.

Level of Service (LOS): A qualitative measure describing the perception of operation conditions within a traffic steam by motorists and or passengers. An LOS rating of "A" to "F" describes the traffic flow on streets and at intersections, ranging from LOS A, representing virtually free flow conditions and no impedance to LOS F representing forced flow conditions and congestion.

*Local (Street)*: A street designated in the functional class system that's primary purpose is to provide access to land use as opposed to enhancing mobility. These streets typically have low volumes and are very short in relation to collectors and arterials.

*Metropolitan Planning Organization (MPO)*: An organization in each federally recognized urbanized area (population over 50,000) designated by the Governor which has the responsibility for planning, programming and coordinating the distribution of federal transportation resources.

*Metropolitan Transportation Improvement Program (MTIP):* The list of projects selected by Metro to receive regional funding assistance.

*Multi-Modal*: Involving several modes of transportation including bus, rail, bicycle, motor vehicle etc.

*Multi-Use Path*: Off-street route (typically recreationally focused) that can be used by several transportation modes, including bicycles, pedestrians and other non-motorized modes (i.e. skateboards, roller blades, etc.)

National Highway System (NHS): The National Highway System is interconnected urban and rural principal arterial and highways that serve major population centers, ports, airports and other major travel destinations, meet national defense requirements and serve interstate and interregional travel.

*Neighborhood (Street)*: A street designated in the functional class system that's primary purpose is to provide access to land use, but provides more mobility than a local street. These streets typically have moderate volumes and are shorter in relation to collectors and arterials.

West Linn Transportation System Plan Technical Appendix

*Neighborhood Traffic Management (NTM):* traffic control devices typically used in residential neighborhoods to slow traffic or possibly reduce the volume of traffic.

*Oregon Highway Plan (OHP):* The document that establishes long range policies and investment strategies for the state highway system in Oregon

Pavement Management System (PMS): systematic method of organizing and analyzing information about pavement conditions.

*Peak Period or Peak Hour*: The period of the day with the highest number of travelers. This is normally between 4-6 PM on weekdays.

*Pedestrian Connection*: A continuous, unobstructed, reasonability direct route between two points that is intended and suitable for pedestrian use. These connections could include sidewalks, walkways, accessways, stairways and pedestrian bridges.

*Pedestrian District*: A comprehensive plan designation or implementing land use regulation, such as an overlay zone, that establishes requirements to provide a safe and convenient pedestrian environment an area planned for a mix of uses likely to support a relatively high level of pedestrian activity.

*Pedestrian Facility*: A facility provided for the benefit of pedestrian travel, including walkways, crosswalks, signs, signals and benches.

*Pedestrian Scale*: Site and building design elements that are oriented to the pedestrian and are dimensionally less than those sites designed to accommodate automobile traffic.

Regional Transportation Plan (RTP): The transportation plan for the Portland Metro region

Right-Of-Way (ROW): A general term denoting publicly-owned land or property upon which public facilities and infrastructure is placed.

Safety Priority Index System (SPIS): an indexing system used by Oregon Department of Transportation to prioritize safety improvements based on crash frequency and severity on state facilities.

*Shared Roadway*: Roadways where bicyclists and autos share the same travel lane. May include a wider outside lane and/or bicycle boulevard treatment (priority to through bikes on local streets).

Sight Distance: The distance a person can see along an unobstructed line of sight.

Single Occupancy Vehicle (SOV): A vehicle containing only a single occupant, the driver.

Single Point Urban Interchange (SPUI): Geometric interchange design that intersects on and off ramps for a facility at a single point

Special Transportation Area (STA): an ODOT designation that allows state facilities that run through downtown business districts to have alternate mobility standards in an effort to accommodate other special needs (such as pedestrian, transit, business, etc) in an area

Statewide Transportation Improvement Plan (STIP): The capital improvement program that identifies founding and schedule of statewide projects

*Traffic Control Devices*: Signs, signals or other fixtures placed on or adjacent to a travelway that regulates, warns or guides traffic. Can be either permanent or temporary.

*Transportation Analysis Zone (TAZ)*: A geographic sub-area used to assess travel demands using a travel demand forecasting model. Often defined by the transportation network and US Census blocks.

Transportation Demand Management (TDM): a policy tool as well as any action that removes single occupant vehicle trips from the roadway network during peak travel demand periods.

Transportation System Management (TSM): management strategies such as signal improvements, traffic signal coordination, traffic calming, access management, local street connectivity, and intelligent transportation systems

*Transportation System Plan (TSP)*: Is a comprehensive plan that is developed to provide a coordinated, seamless integration of continuity between modes at the local level as well as integration with the regional transportation system.

*Urban Area*: The area immediately surrounding an incorporated city or rural community that is urban in character, regardless of size.

*Vehicle Miles Traveled (VMT):* The cumulative distance a vehicle travels, regardless of number of occupants

**SUBJECT:** Task 2: Technical Memorandum # 1 – Background Document Review

P06246-000

This memorandum provides a review of transportation policy framework and standards applicable to the City of West Linn TSP update. The information provided will be used to draft a policy framework for these studies.

A review of past plans, maps and studies was conducted to determine key elements that would have an impact on the Transportation System Plan update process for the City of West Linn. The following section summarizes key findings, and provides highlights of the relevant issues from state, county and city planning documents. This background review is useful throughout the TSP update project because it identifies how local plans fit into the larger regional context. Other reports addressing specific area master plans or feasibility studies will be considered through the process, as appropriate, but the land development and travel forecasts done in conjunction with the TSP generally supersede these studies.

#### Summary

The City of West Linn TSP update will include responses to transportation, land use, environmental, economic and social changes that have occurred in the community since the TSP was first prepared. The update will also attempt to anticipate emerging issues.

Key transportation plan considerations/requirements derived from rules and policies found during the Plan and Document Review include the following:

- The 2001 Oregon Transportation System Planning Guidelines should be used for general transportation system planning assistance
- TPR requirements (OAR 660-12-0050 and -0055) direct the amendment of local TSPs for proposed land use plan amendments.
- Comply with State access management and interchange spacing standards for Interstate Highway I-205 and State Highway 43.
- Follow the guidance of OHP policies related to:
  - o Coordination of land use and transportation planning coordination between the City, County, TriMet, Metro and the State;
  - o Mobility standards on highways I-205 and OR 43
  - o Off-system improvements, where the State may financially assist local jurisdictions in local road projects that are cost-effective, improving conditions on state facilities.
- Adopt a Congestion Management System into the proposed Transportation Demand Management to comply with Metro's 2040 vehicle occupancy goals and the TPR's requirement for a reduction in vehicle miles traveled per capita
- Adopt Metro's street and walkway spacing standards
- Coordinate with Metro and ODOT for refinement planning for I-205 corridor
- Consistency with Metro's 2030 population and employment forecast for TSP development and analysis

City of West Linn TSP Update Technical Memorandum #1 April 11, 2007 Page 3 of 24

The following sections summarize the key documents, plans, and regulations that were reviewed to consolidate the consideration/requirements listed above. These are summarized by jurisdiction for the State of Oregon, Clackamas County, and the City of West Linn.

#### State Plans & Regulations

#### Oregon Transportation Plan (OTP)

The Oregon Transportation Plan (OTP) sets the general direction for transportation development statewide for the next twenty years and provides overall direction for allocating resources and coordinating modes of transportation. It provides policies to increase livability in the State of Oregon by emphasizing alternative forms of transportation to the single occupant vehicle. The plan seeks to develop public transit, rail lines, bicycling and pedestrian facilities, airports and pipelines, while also emphasizing the maintenance and improvement of highways, roads and bridges. Thus, the plan calls for a transportation system that has a modal balance, is both efficient and accessible, provides connectivity among rural and urban places and between modes, and is environmentally and financially stable. The City of West Linn TSP currently incorporates these goals and strategies and they will be carried forward in the update.

#### 1999 Oregon Highway Plan

The 1999 Oregon Highway Plan (OHP) defines policies and investment strategies for Oregon's state highway system for the next 20 years by further refining the goals and policies of the Oregon Transportation Plan (OTP). One of the key goals of the OHP is to maintain and improve safe and efficient movement of people and goods, while supporting statewide, regional, and local economic growth and community livability. The implementation of this goal occurs through a number of policies and actions that guide management and investment decisions by defining a classification system for state highways, setting standards for mobility, employing access management techniques, supporting intermodal connections, encouraging public and private partnerships, addressing the relationship between the highway and land development patterns, and recognizing the responsibility to maintain and enhance environmental and scenic resources. The OHP gives policy and investment direction to large-scale facility plans and TSPs, but is not intended to direct specific projects and modal alternatives.

Specific OHP policies with bearing on transportation planning and updating in West Linn include the following.

- Policy 1A State Highway Classification System
  - The state highways in West Linn include the East Portland Freeway (Interstate-205), classified as an Interstate Highway and Oswego Highway No. 3(State Highway 43), with a small section classified as a District Highway and the rest classified as a State Highway in the National Highway System.
- Policy 1B: Land Use and Transportation

April 11, 2007 Page 4 of 24

Land use and transportation planning and development need to be coordinated between state, regional, county, and city agencies.

#### • Policy 1F: Highway Mobility Standards

District Highways inside UGB and MPO should have a maximum v/c of 0.90. State Highways should have a maximum v/c of 0.80 and Interstate Highways should have a maximum v/c of 0.80 in MPO areas.

#### • Policy 1G: Major Improvements

Efficiency and other management measures must be instituted before adding capacity.

#### • Policy 2A: Partnerships

The limited resources available for transportation planning and development should be efficiently and effectively used by coordinating the efforts of ODOT and other agencies, in this case the City of West Linn.

#### • Policy 2B: Off-System Improvements

The State is to provide financial assistance for local road projects when the projects are cost-effective in improving state facility conditions.

#### • Policy 2D: Public Involvement

Offer opportunities for effective public involvement in transportation planning and project development.

#### • Policy 2F: Traffic safety

Increase the safety of the state transportation system through engineering, education, enforcement, and emergency services.

Goal 3 (Access Management) is critical in transportation planning efforts that involve state transportation facilities. This goal is implemented through OAR 734-051, which is reviewed later in this chapter. Goal 4 (Travel Alternatives) and Goal 5 (Environmental and Scenic Resources) also apply to the TSP update, if in limited ways. Goal 5, with an aim to go beyond what is required by other state and federal regulations, calls for natural resources to be maintained and even improved by transportation planning and projects involving state facilities. The highways of statewide importance that are specifically identified in The Highway Plan in the City of West Linn include:

• Interstate 205, which is classified as a Interstate Highway and Major Freight Route with the primary objective being to provide mobility between urban areas and a secondary objective being to provide mobility for regional trips *within* a metropolitan area. The

#### City of West Linn TSP Update Technical Memorandum #1 April 11, 2007 Page 5 of 24

- operations of this facility should be safe and efficient high-speed continuous flow. The maximum volume to capacity ratios for peak hour operating conditions is 0.70.
- State Highway 43, which is classified as a District Highway and a State Highway. Between the city limits to the south and the I-205 interchange to the north, the facility is classified as a District Highway, and is classified as a State Highway on the National Highway System for the rest of its length inside the city limits.
  - The District Highway portion of this facility functions as a city arterial or collector. In urban areas, such as the City of West Linn, this facility should provide moderate to low-speed operation for traffic flow to allow for significant pedestrian and bicycle movements. Mobility is to be balanced with local access. The maximum volume to capacity ratios for peak hour operating conditions varies from 0.85 to 0.80, depending on posted speed limits.
  - o The State Highway portion of this facility provides inter-urban and inter-regional mobility, as well as connections for intra-urban and intra-regional trips. This facility should provide safe and efficient, high-speed, continuous-flow operation, and interruptions to flow should be minimal.

#### Oregon Public Transportation Plan

The Oregon Public Transportation Plan develops transit, rideshare and transportation demand management services as well as implementing the public transportation system envisioned in the OTP. The plan describes the roles and responsibilities of key players, provides a financial investment strategy and identifies both short and long term implementation steps. The plan provides minimum levels of service standards for public transportation operations. These criteria include peak and off-peak frequencies, vehicle maintenance programs and replacement schedules, intermodal connections and ridesharing.

#### Oregon Statewide Planning Goals (OAR 660-015)

The Oregon Statewide Planning Goals provide a foundation for expressing state policy on land use planning. The 19 goals for land use planning in the state are to be achieved through local comprehensive planning. Local comprehensive plans must be consistent with the Statewide Planning Goals.

The Transportation goal (Goal 12) is a safe, convenient, multimodal and economic transportation system. Consideration of local and regional economies, social consequences, environmental impacts, energy, the needs of transportation disadvantaged, and over reliance on a single mode should be included in local plans. Guidelines for planning and implementation are included to support the Statewide Planning Goals.

Page 6 of 24

#### Oregon Transportation Planning Rule (TPR) (OAR 660-012)

The State of Oregon adopted 19 statewide planning goals that must be implemented in a comprehensive plan for each city (with a population over 2,500 individuals) and county in the state. In addition to identifying how land, air and water resources of each specific jurisdiction will be utilized, a review and needs analysis must be completed for improving public facilities. One of the 19 goals is the Transportation Planning Rule (Goal 12). To comply with this rule, West Linn must adopt a Transportation System Plan (TSP) that complies with the State TSP. The overarching goals to be accomplished by the TPR are to:

- Reduce dependence on the automobile and the number of people driving alone.
- Establish a stronger connection between land use and transportation planning.

Local TSPs are expected to examine possible land use solutions to transportation problems and identify multi-modal, system management and demand management strategies to address transportation needs. This entails the development of modal plans, including pedestrian, bicycle, motor vehicle and transit. These plans must strive to provide an integrated transportation network and include an inventory of current infrastructure, provide a gap analysis and identify how these gaps are going to be filled. The areas of analysis addressed in the TPR for a transportation system plan include:

- Roadway capacity and level of service
- Transit capacity and capacity utilization
- Bicycle and pedestrian system capacity
- Adjustment of turning movement volumes produced by travel demand forecasting models
- Estimation of future transportation needs (person travel), reflecting:
  - o Population and employment forecasts consistent with comprehensive plans
  - Measures to reduce reliance on the automobile
  - o Increased residential, commercial and retail development densities
  - o Location of neighborhood shopping centers near residential areas
  - o Better balance between jobs and housing
  - o Maximum parking limits for office and institutional developments
  - Appropriate levels of transportation facilities to serve land uses identified in transportation plans
  - Increases in average automobile occupancy
  - o Increases in modal shares of non-automobile modes
  - o TDM programs
  - o Land use and subdivision regulation

Page 7 of 24

- Estimation of future goods movement
- Access management

In addition to requiring that all jurisdictions have an adopted TSP that complies with the State TSP, jurisdictions must have policies and ordinances that implement their adopted plan. The TPR requires that local governments adopt land use regulations consistent with state and federal requirements "to protect transportation facilities, corridors, and sites for their identified functions OAR 660-012-0045(2)." The requirements of OAR Section 660-12-045, Implementation of the Transportation System Plan, are summarized in Appendix A of this document and include recommendations for compliance.

The Oregon Land Conservation and Development Commission (LCDC) adopted amendments to TPR section 660-12-0050 (Transportation Project Development) and -0055 (Timing of Adoption and Update of Transportation System Plans; Exemptions) in 2005. The amendments clarify planning requirements for amending local TSPs when land use plan amendments are proposed. Section 660-12-0060 was also amended in 2005 and includes new guidance for local jurisdictions on how to make a determination on whether or not an amendment to the City's adopted plans or land use regulations has a significant affect on a transportation facility. The TSP update should reflect these new requirements.

#### Access Management Rules (OAR 734-051 – Division 51)

The purpose of Oregon's Access Management Rule is to control the issuing of permits for access to state highways, state highway rights of way and other properties under the State's jurisdiction. In addition, the ability to close existing approaches, set spacing standards and establish a formal appeals process in relation to access issues is also identified.

These rules enable the State to set policy and direct location and spacing of intersections and approaches on state highways, ensuring the relevance of the functional classification system and preserving the efficient operation of state routes. Regulating access can:

- Protect resource lands
- Preserve highway capacity
- Ensure safety for segments of state routes with sharp curves, steep grades or obstructed sight distance.

April 11, 2007 Page 8 of 24

The access management standards adopted by ODOT are summarized in the table below.

**Table 1: ODOT Access Management Standards** 

Posted Speed (MPH)													
Facility	>55	50	40,45	30,35	<20								
Statewide Highway (feet)	1320	1100	990	770	550								
District Highway (feet)	700	550	500	350	350								

These standards will be used in the TSP update to establish a connectivity plan, verify access spacing for any proposed highway interchanges and analyze current access conditions on congested state highways. The TSP update will work towards compliance with these standards on existing roadways where they are currently unmet. The standards will be applied to all rights of way under the State's jurisdiction in the City of West Linn.

#### Sustainability and Quality Development Executive Orders

Executive Orders related to sustainability have been issued in support of the Oregon Sustainability Act in 2000, 2003, and 2006. The 2000 Executive Order (EO-00-07) identified the goals and guidelines for sustainability in Oregon and adopted sustainability practices in state government operations. The 2003 Executive Order (EO-03-03) established sustainability planning within state agencies consistent with the goals identified in the Oregon Sustainability Act. Executive Order 06-02 supersedes the prior Executive Orders and identifies the roles of state agencies in carrying out sustainability goals.

Executive Order (EO-00-23) identifies objectives and implementation policy for quality development. Quality development objectives included mixed-use development which encourages walking, biking, and transit use.

#### State Transportation Improvement Program

The current adopted (2006-2009) Statewide Transportation Improvement Program (STIP) serves as ODOT's short-term capital improvement program and provides funding and scheduling information for transportation projects for both ODOT and the metropolitan planning organizations in the state. Projects funded in the STIP reflect and advance the Oregon Transportation Plan for highways, public transportation, freight and passenger rail and bicycle and pedestrian facilities. Additionally, monies obtained from the sale of state bonds authorized in the 2003 Oregon Transportation Investment Act (OTIA III) and placed in the STIP coffers have been dedicated to modernization, bridge and pavement preservation projects. Therefore, many of the projects in the 2006-2009 STIP are preservation oriented.

The following projects will have an impact on the West Linn transportation system:

• Turn lane construction and bike and ped improvements to Oswego Highway, OR 43 at milepoint 10.25 (total cost \$223,000, Key Number 11427).

City of West Linn TSP Update Technical Memorandum #1 April 11, 2007 Page 9 of 24

- Overlay and addition of auxiliary lanes along I-205 between milepoints 0.00 and 8.8 (total cost \$48,296,000, Key Number 12874).
- Rehabilitation and historic bridge work on the Willamette River Bridge (OR 43) between milepoints 11.33 and 11.47 (total cost \$4,163,000, Key Number 14014).

#### Oregon Bicycle and Pedestrian Plan

The provision of safe and accessible bicycling and walking facilities in an effort to encourage increased levels of bicycling and walking is the goal of the Oregon Bicycle and Pedestrian Plan. The Plan provides actions that will assist local jurisdictions in understanding the principals and policies that ODOT follows in providing bike and walkways along state highways. In order to reach the plan's objectives, the strategies for system design are outlined, including:

- Providing bikeway and walkway systems that are integrated with other transportation systems;
- Providing a safe and accessible biking and walking environment; and
- Development of education programs that improve bicycle and pedestrian safety.

The document includes two sections, including the *Policy & Action Plan* and *Bikeway & Walkway Planning Design, Maintenance & Safety*. The first section contains background information, legal mandates and current conditions, goals, actions, and implementation strategies ODOT proposes to improve bicycle and pedestrian transportation. The second section assists ODOT, cities and counties in designing, constructing and maintaining pedestrian and bicycle facilities. Design standards are recommended and information on safety is provided. Transportation alternatives developed through the study process will need to provide for bicycle and pedestrian travel as recommended in this plan.

# ODOT Reconnaissance Report; East Portland Freeway No. 64 (I-205), SW Stafford Rd. – Pacific Highway 1I (OR 99E) Section, Clackamas County

June 2003

The goal of the study was to determine the feasibility, approximate cost, and conceptual engineering configuration of adding a lane of capacity in each direction on I-205 between the OR 99E interchange and Stafford Road interchange. The objectives of the study included identifying operational and functional needs along this segment of I-205 and identifying the feasibility and cost of adding a third lane in each direction. The transportation modeling documented in the report concluded that widening I-205 between the Stafford Road and Highway 99E interchanges to provide a third through lane in each direction would be able to accommodate the forecast year 2025 traffic demands through the I-205 corridor in the study area.

The study also resulted in a conceptual engineering footprint for an "ultimate future" design of four lanes in each direction along this corridor. The study states that it is unlikely that ODOT

City of West Linn TSP Update Technical Memorandum #1 April 11, 2007 Page 10 of 24

will widen this corridor section to four lanes in the near future, but that any major improvements made in the corridor should be done with the "ultimate future" concept in mind.

#### State Historic Preservation Office (SHPO) Historic Survey and Inventory

The SHPO Historic Survey and Inventory is a database which contains documents and electronic data from historic surveys, the National Register of Historic Places and Section 106 Review and Compliance surveys. The Oregon Historic Inventory is available for research purposes by appointment at the SHPO office. The SHPO places a number of restrictions on archeological surveys and the procedures for completing one. Information on known archaeological sites is not available to the general public. SHPO's database should be referenced for conflicts between historic sites and the proposed transportation system.

#### Oregon Natural Heritage Program (ORNHP)

The Oregon Natural Heritage Program is a cooperative program, managed by the Oregon Natural Heritage Information Center, to identify the plant, animal, and plant community resources of Oregon. The ORNHP database is Oregon's most comprehensive database of rare, threatened and endangered species and includes site-specific information on the occurrences, biology and status of over 2,000 species throughout Oregon. It includes the state's only database of natural vegetation, with descriptions and information on the occurrences and protected locations of all known ecosystem types. The Natural Heritage Data System provides information to guide implementation of the Natural Heritage Plan. It is also contracted to provide natural heritage and sensitive species information to state and federal agencies. ORNHP database should be referenced for conflicts between sensitive plant and animal species and the proposed transportation system.

#### TriMet Transit Investment Plan

TriMet's Transit Investment Plan (TIP) lays out TriMet's strategies and programs to meet regional transportation and livability goals through focused investments in service, capital projects and customer information. The TIP is a rolling five-year plan that is updated annually. The TIP relies on long-term goals and strategies developed by Metro, including the Regional Transportation Plan (RTP). These plans direct development to Regional Centers, Town Centers and key corridors. The TIP shows how TriMet will implement the transit portion of the RTP over the next five years. The TIP has four priorities to complete their goals:

- 1. **Build the "Total Transit System":** Enhance customer information, access to transit, stop amenities, frequency, reliability, passenger comfort, safety and security.
- 2. **Expand high-capacity transit:** Invest in MAX Light Rail, Commuter Rail and Streetcar service along key corridors to connect regional centers.
- 3. **Expand Frequent Service:** Add to TriMet's network of bus lines that run every 15 minutes or better, every day.
- 4. **Improve local service:** Work with local jurisdictions to improve transit service in specific local areas.

April 11, 2007 Page 11 of 24

Priorities identified in the TIP which could directly or indirectly impact transportation in and around the City of West Linn include:

• Frequent Service on Line 35-Macadam connecting West Linn, Oregon City and Portland.

#### Regional Transportation Plan

Metro, 2004

The 2004 Regional Transportation Plan (RTP) lays out the 20-year priorities for road, transit, freight, bicycle and pedestrian improvements. A goal of this planning effort is a more streamlined plan that better advances regional policies, public priorities and local efforts to implement the 2040 Growth Concept. The RTP defines regional transportation policies which all city, county, TriMet, ODOT, and Port of Portland plans must follow. These policies are for all forms of travel including motor vehicle, transit, pedestrian, bicycle and freight. The plan then establishes priority projects for each mode based on the stated policies. The plan is based on forecasts of growth in population, households and jobs as well as future travel patterns and analysis of travel conditions. In identifying priority projects, the plan estimates availability of federal, state and local funding for transportation improvements. Cost estimates for each project are also developed, as well as funding strategies identified. Local transportation plans are required by state law to be consistent with the RTP. The following table summarizes the key ways the West Linn TSP must comply with the RTP:

Issue	Existing TSP Complies	Update Must Address
Local TSP Development and Implementation requirements (Identify needs for 20 year planning period)	Chapters	Yes
System level planning (by mode)	Chapters	Yes
Project level planning (by mode)	Chapters	Yes
Design Standards for Street Connectivity		Yes
Alternative Mode Analysis	Chapters	Yes
Motor Vehicle Congestion Management System		Yes
Access Management Plan	Chapter	Yes
Performance and Functional Classification Standards		Yes
Future RTP Refinements		Yes
Transit Service Planning	Chapter	Yes
Regional Parking Plan	Chapter	Yes
Project Development		Yes
Refinement Planning		No
Specific Corridor Refinements		None
Specific Corridor Studies		None
Area of Special Concern		None

One project identified by Metro in their RTP for construction between 2004 and 2009 is an upgrade of Willamette Falls Drive to urban standards with bike lanes and sidewalks.

#### Transportation System Planning Guidelines

ODOT, Revised 2001

The TSP Planning Guidelines give an overview of what is involved in a TSP. TSPs adopted after January 1, 2000 must be consistent with the Oregon Highway Plan. The guideline document is designed to provide assistance to local jurisdictions in the preparation and update of TSP's to comply with requirements associated with:

- Transportation Planning Rule 1999, OAR 660
- Access Management Rules, 2000 OAR 734
- Oregon Public Transportation Plan, 1997
- Oregon Highway Plan, 1999
- Oregon Aviation Plan, 2000
- Executive Order 12898 on Environmental Justice for Minority and Low Income Populations: USDOT Order 56102 and FHWA Order 6640.23.
- Executive Order EO-23 on Quality Development
- Executive Order EO-00-07 on Sustainability

The West Linn TSP update will include responses to transportation, land use, environmental, economic and social changes that have occurred in the community since the TSP was first prepared. The update will also attempt to anticipate emerging issues.

## Clackamas County Planning Documents

#### Clackamas County Comprehensive Plan

Clackamas County, April 2005

The Comprehensive Plan for Clackamas County acts as a guide for future growth and development through the formation of goals and policies that respond to current and future needs over a 20-year planning period. Goals and policies pertaining to land use are implemented through zoning ordinances that are used to define various land use designations and create zone maps for the county identifying where these land use designations will be applied. The Transportation chapter focuses on developing a transportation system that meets the needs of Clackamas County residents, while also considering regional and state needs at the same time. The plan addresses a balanced transportation system that includes automobile, bicycle, rail, transit, air, pedestrian and pipelines and reflects existing land use plans, policies and regulations that affect the transportation system. The Clackamas County Transportation System Plan implements these goals and policies and provides a Transportation Project List to address

April 11, 2007 Page 13 of 24

deficiencies. Management policies for State Highways are also developed in the Transportation Chapter and carried forward through the Transportation System Plan.

The general transportation goals for Clackamas county include:

- Create a safe, efficient and effective transportation system -- with multiple modes -- that balances the needs of the economy, protects the environment, conserves natural resources, and protects neighborhoods.
- Work in partnership with neighboring and affected agencies in transportation planning to ensure effective and efficient results.
- Prepare a financial plan to fund the projects included in the Capital Improvement Plan (CIP).
- Use all financial means possible and take the lead in developing new funding sources to construct needed projects.
- Work to maximize dollar return from state, regional and federal sources for County transportation projects.
- Schedule transportation system improvements to coincide with the needs of new development.

There are a number of projects identified on Map V-1a in the county's comprehensive plan for the next twenty years. These projects are listed in the below.

#### **Urban Transportation System Plan (TSP)**

Clackamas County, 1999

The Clackamas County Urban TSP provides a framework for addressing the transportation needs of Clackamas County over the next 20 years, and works within the framework provided by the related state, regional and local plans. The plan was created through an extensive citizen involvement process and represents the vision and goals of the community. The purpose of the plan is to facilitate multi-modal transportation needs of County citizens with coordination between transportation system improvements and land use requirements.

The plan defines goals and policies, identifies transportation system facilities in the county and suggests recommended improvements. Recommended improvements are based on county profiles, trends, and a detailed needs assessment.

Clackamas County projects identified in the TSP include projects from the TSP needs assessment, the 1998/1999 to 2003/2004 Clackamas County Capital Improvement Plan (CIP), and City TSPs. The following projects identified in the 20-year TSP project list will have an impact on the West Linn transportation system:

- Rosemont Road: Reconstruct and widen (Stafford Road to Parker Road)
- Rosemont Road: "Realign intersection, add turn lanes" (Rosemont/Parker/Day intersection)
- Parker Road: Reconstruct and widen (urban) (Rosemont Road to Sunset Road)
- Willamette Falls Drive: Reconstruct and widen (urban) (Highway 43 to 10th Avenue)
- Petes Mountain Road Reconstruct and widen (rural) (Willamette Falls Road to Hoffman Road)

City of West Linn TSP Update Technical Memorandum #1 April 11, 2007 Page 14 of 24

#### Capital Improvement Plan (CIP)

The capital improvement plan implements the goals and policies that have been adopted into the Clackamas County Transportation System Plan. The CIP is a 5-year plan for capital improvements which lists specific projects and includes a financial plan. The Clackamas County CIP is updated annually. The current adopted 2006/-2010/11 CIP is an update from the 1998/1999 to 2003/2004 plan referenced in the Clackamas County TSP. There is one West Linn area projects included in the current 5-Year Program.

• Tualatin River (Borland Road) Bridge: Replace existing bridge

#### City of West Linn Documents

#### Comprehensive Plan

The West Linn Comprehensive Plan provides a framework for future development by presenting goals and policies in a wide array of subjects related to development, including urbanization, land use, housing, natural and cultural resources, environmental quality, public facilities and services, energy and transportation.

Public involvement policies require public hearings and opportunities for citizen participation during the consideration of amendments to the City's Comprehensive Plan, a requirement that adoption of an updated TSP will trigger. Natural resource policies protect habitat and natural systems around the city, the most sensitive areas being associated with the city's rivers and streams. Transportation planning and projects should minimize impacts to these resources as well as minimize degradation of air, water, and general environmental quality, and avoid areas of natural hazards.

The Comprehensive Plan has policies in place which describes the types of transportation facilities and activities permitted in each of the City's land use districts. Emphasis is not only placed on motor vehicle transportation, but also on bicycle, pedestrian, transit, water, and freight. Additionally there is a policy in place to encourage transportation demand management.

#### **Z**oning

The city of West Linn has multiple classifications for the zoning of residential, commercial and industrial zones within the city including:

- Low Density Residential
- Medium Density Residential
- Medium High Residential
- Mixed Use
- Commercial
- Industrial
- Other
- Historical Landmarks

Each of the different zoning designations has different requirements for land use. A city can use zoning to influence traffic demand on their transportation facilities.

#### City of West Linn TSP Update Technical Memorandum #1 April 11, 2007 Page 15 of 24

The City of West Linn has identified 29 historic landmarks throughout the city. In order for a structure, site, or object to be zoned as an Historic Landmark, a listing on the "National Register of Historic Places is required," unless it meets the requirements set forth by the Planning Commission.

#### Transportation System Plan

The adopted 2000 West Linn Transportation System Plan (TSP) was developed to provide an extensive review of the transportation system, evaluate deficiencies in the system and plan for future improvements for the area through the year 2020. A key objective of this plan was to achieve a balanced, safe transportation system that meets the needs of all modes of travel, including pedestrians, bicycles, transit, motor vehicles and other modes (e.g. rail, air). The TSP outlines the City's goals for developing its transportation facilities to meet short and long term needs, while addressing its transportation demand management (TDM) strategies. Existing conditions were assessed and future needs through 2020 were determined based on growth assumptions. A master plan for each travel mode was recommended to meet the city's goals and local performance standards. A project list for each travel mode was prepared including estimated costs. The TSP also provides funding strategies. The TSP update will consider and incorporate all findings and projects from the adopted TSP that are still relevant in addition to incorporating new projects.

#### **Buildable Lands Analysis**

The 2006 West Linn Buildable Lands Analysis (BLA) identifies available land and is updated on a yearly basis. Land available for development is classified as infill, approved for development, or vacant. The 2006 BLA Update provides new information that has become available through December 31, 2005. Population residential housing unit forecasts are used to arrive at forecasted land needs. These forecasts provide the City with valuable information to aid in development of economic goals and policies to assist in shaping the community by attracting desirable commercial and industrial businesses and in providing a range of housing options.

#### Major Development Proposals

A number of project applications have been received by the city for consideration as of October 2006. These projects vary in size and possible impact on the city's transportation resources. Pending and approved projects include a 71-lot subdivision in south-west West Linn, a 6-lot subdivision in central West Linn, and a new church in north-central West Linn. The project applications reviewed by the city are updated monthly.

#### **Environmental Inventories**

Natural resources and environmental considerations in West Linn must be considered when developing transportation plans. The following sources provide information relevant to transportation system planning in the City of West Linn:

April 11, 2007 Page 16 of 24

- National Wetlands Inventory A map of West Linn wetlands depicts the location of rivers, streams, wetland areas and stormwater facilities in West Linn. Any adverse transportation related impacts that may compromise the water quality or wetland resources in the City of West Linn will be identified in the TSP Update.
- Department of Environmental Quality Inventory Awaiting Documentation (Possibly not available)
- Oregon Department of Fish and Wildlife Inventory Abundance and distribution of Fish Species in West Linn Streams Final Report 2003-2004 is a inventory of fish collected from streams in the City of West Linn from the summer 2003 to summer 2004. From their study, the Oregon Fish and Wildlife researchers came up with 6 recommendations:
  - a. Improve fish passage by constructing fish culverts along Trillium Creek
  - b. Remove non-native vegetation
  - c. Develop priorities for habitat protection and restoration
  - d. Conduct regular fish and habitat inventories
  - e. Conduct surveys to evaluate abundance, biomass, spatial structure, habitat use, and movements of salmonids
  - f. Monitor and evaluate habitat improvements
- United States Fish and Wildlife Service Inventory Awaiting Documentation

#### Oregon Conservation Strategy

Oregon Department of Fish and Wildlife, February 2006

The Oregon Conservation Strategy is an overarching strategy for the conservation of fish and wildlife that contains elements addressing species, habitats, problems, conservation actions, monitoring, strategy review, interagency coordination, and public involvement. Key conservation issues addressed in *The Oregon Conservation Strategy* include:

- Work with community leaders and agency partners to ensure planned, efficient growth, and to preserve fish and wildlife habitats, farmland, forestland and rangeland, open spaces, and recreation areas.
- Use, expand, and improve financial incentive programs and other voluntary conservation tools to support conservation actions taken by landowners and land managers.
- Develop new voluntary conservation tools to meet identified needs.
- Promote collaboration across jurisdictional and land ownership boundaries.
- Work creatively within the existing regulatory framework, seeking new opportunities to foster win-win solutions.

April 11, 2007 Page 17 of 24

 Inform Oregonians of conservation issues and the actions everyone can take that will contribute to Oregon's collective success.

The City of West Linn is located in the Willamette Valley Ecoregion; *The Oregon Conservation Strategy* divides up the state into regions with similar climate and wildlife. Within specific ecoregions, it outlines conservation opportunity areas which include information on recommended conservation actions, special features, key species, key habitats, and if the area has been identified as a priority by other planning efforts.

■ The waterfront along the Willamette River in West Linn has been identified as a Conservation Opportunity Area.

### Appendix A: Transportation Planning Rule Compliance

The Transportation Planning Rule (TPR) requires all jurisdictions to complete a transportation system plan (TSP), including policies and ordinances to implement that plan. The TPR requires that local governments adopt land use regulations consistent with state and federal requirements "to protect transportation facilities, corridors, and sites for their identified functions OAR 660-012-0045(2)." The City's current TSP was adopted in 1998, with the exception of the street element (Chapter 3), which was adopted in 2000. A new document is being prepared to comply with the revised TPR and to more accurately reflect the current transportation system and predict the future needs of West Linn.

The applicable portion of the TPR is found in OAR Section 660-12-045, Implementation of the Transportation System Plan. In summary, the TPR requires that local governments revise their land use regulations to implement their adopted TSP in the following manner:

- □ *Amend land use regulations to reflect and implement the TSP.*
- □ Clearly identify which transportation facilities, services, and improvements are allowed outright, and which will be conditionally permitted or permitted through other procedures.
- □ Adopt land use or subdivision ordinance measures, consistent with applicable federal and state requirements, to protect transportation facilities, corridors and sites for their identified functions, to include the following topics:
  - access management and control;
  - protection of public use airports;
  - protection of the future operations of roadways and transit corridors;
  - coordinated review of land use decisions potentially affecting transportation facilities;
  - conditions to minimize development impacts to transportation facilities;
  - regulations to provide notice to public agencies providing transportation facilities and services of land use applications that potentially affect transportation facilities;
  - regulations assuring that amendments to land use designations, densities, and design standards are consistent with the Transportation System Plan.
- □ Adopt land use or subdivision regulations for urban areas and rural communities to provide safe and convenient pedestrian and bicycle circulation and bicycle parking, and to ensure that new development provides on-site improvements that accommodate pedestrian and bicycle travel.
- □ *Establish street standards that minimize pavement width and total right-of-way.*

The following assessment of TPR compliance is based on West Linn's Community Development Code. Table 1 lists TPR implementation requirements, an assessment of existing City code and

April 11, 2007 Page 19 of 24

regulatory provisions that meet the requirements, and recommendations for changes to the West Linn Community Development Code that will likely be needed to fully implement the a new TSP and bring the City regulations in compliance with the TPR. Recommended changes to local regulatory documents, indicated in **bold text**, are intended to provide guidance to project staff during the update of the TSP. In particular, modifications to the Community Development Code will be drafted during the planning process and become implementation recommendations for inclusion in the draft TSP.

Table 1. TPR Requirements and City of West Linn	Compliance
TPR Requirement (OAR Section 660-12-0045)	Ordinance Compliance/Recommendations
(1) Each local government shall amend its land use regulations to implement the TSP.	
(b) To the extent, if any, that a transportation facility, service, or improvement concerns the application of a comprehensive plan provision or land use regulation, it may be allowed without further land use review if it is permitted outright or if it is subject to standards that do not require interpretation or the exercise of factual, policy or legal judgment.	No transportation facilities are listed as either allowed uses or conditional uses under the zoning district chapter in the Community Development Code. The exception is heliports, which are a conditional use in the Office-Business Center (OBC), General Commercial (GC), and General Industrial (GI) zones.  Recommendations For clarity, the Zoning Districts section of the Community Development Code should be modified to include transportation facilities, including pedestrian and bicycle amenities, as an outright permitted use in each of the City's zones where it is appropriate.  The City may wish to consider permitting outright - with no further land use review and subject to the standards established by the TSP - only projects identified in the TSP. All other projects would be subject to a conditional use process in order to fully assess the details related to projects and any associated community concerns.
<ul> <li>(c) Local governments shall provide a review and approval process that is consistent with 660-012-0050</li> <li>(Transportation Project Development). Local governments shall amend regulations to provide for consolidated review of land use decisions required to permit a transportation project.</li> </ul>	The City does not have an adopted process specifically for roadway review or to permit a transportation project. The Community Development Code does not specify which types of transportation projects involve land use decision making.  Recommendation: The City should develop/document a clear and objective review process for the approval of land use decisions required to permit a transportation project.
(2) Local governments shall adopt land use or subdivision ordinance regulations, consistent with applicable federal and state requirements, to protect transportation facilities for their identified functions.	
(a) Access control measures.	Section 48.060 of the Community Development Code, Width and Location of Curb Cuts and Access Separation Requirements, specifies the distance between curb cuts and an intersecting street right-of-way line for arterial, collector and local streets (48.060(C)). Section 48.060(D) specifies the minimum distance between any two adjacent curb cuts on the same side of a public street.

Table 1. TPR Requirements and City of West Linn Compliance											
TPR Requirement (OAR Section 660-12-0045)	Ordinance Compliance/Recommendations										
	Section 48.070 gives authority to the Planning Director and City Engineer to restrict the location of driveways upon finding that the proposed access would provide inadequate access for emergency vehicles or would cause or increase hazardous conditions to exist which would constitute a clear and present danger to the public health safety and general welfare.										
	Recommendations: The Community Development Code does not reference use of access management rules to maintain an adequate level of service and the functional classification of roadways. Access control standards should specify the authority of the City and other regulatory agencies to require traffic impact studies, the closing or consolidation of existing curb cuts, and limiting the number of access points for the purpose of ensuring the safe and efficient operation of the street and highway system. The Code should include public road spacing, median control and signal spacing standards. These standards should implement the recommendations of the TSP, be consistent with the City's public works engineering standards and be consistent with the functional classification of roads.										
(b) Standards to protect the future operations of roadways and transit corridors	The City has the authority to require a transportation analysis be submitted for a tentative subdivision or partition plan in cases where the City Engineer determines that the proposed development may have off-site traffic impacts (Land Division, Section 85.170(B)(2)).										
	Recommendation: The City should amend the Community Development Code to include non-discretionary criteria to determine when a transportation impact analysis is required and when conditions of approval may be required.										
(d) Coordinated review of future land use decisions affecting transportation facilities, corridors or sites	The City's Administrative Procedures for both legislative and quasi-judicial decisions includes required notice to "any affect governmental agency." Section 98.070(C)(1)(a), pertaining to legislative decisions, specifies that notice will be given to ODOT.										
(e) Process to apply conditions to development proposals in order to minimize impacts and protect transportation facilities	Section 85.070, Administration and Approval Process, states that the Planning Director shall approve, deny, or approve with conditions, an application for a partition and that the Planning Commission shall approve, deny, or approve with conditions, an application for a tentative plan for a subdivision.										
	The Community Development Code does not include a process to apply development conditions in order to minimize impacts to transportation facilities.										
	Recommendations: While Code Section 85.070 gives some discretion in applying conditions of approval to new development, the City should specify that minimizing impacts to transportation facilities may be a factor in imposing conditions. Code language should be amended to include a requirement that development proposals include data on the

	potential traffic impacts. The City ordinance(s) should include a process to apply conditions to development proposals that will affect City road facilities by more than a certain number of average daily motor vehicle trips.										
	See the TPR requirements in section 660-012-0060 below.										
(f) Regulations to provide notice to public agencies providing transportation facilities and services, MPOs, and ODOT of: land use applications that require public hearings, subdivision and partition applications, applications which affect private access to roads, applications within airport noise corridor and imaginary surfaces which affect airport operations.	The City's Administrative Procedures for both legislative and quasi-judicial decisions includes required notice to "any affect governmental agency." Section 99.080(A)(1)(c), pertaining to quasi-judicial decisions, specifies that notice will be given to ODOT.										
(g) Regulations assuring amendments to land use designations, densities, design standards are consistent with the function, capacities, and levels of service of facilities	The Community Development Code does not contain provisions ensuring that amendments to densities or design standards be consistent with the designated facilities in the TSP.										
designated in the TSP.	Recommendations: The City should amend the Community Development Code to include clarification that approval of amendments to land use designations, densities, and design standards are contingent on findings of consistency with the planned transportation system, as adopted in the City's TSP. Language that governs zone changes and plan amendments should be revised to include reference to TPR Section –0060 (see Section 660-12-0060 below), or should include language from this TPR section that states under what circumstances a plan or land use regulation amendment "significantly affects a transportation facility" and the mitigation that is required. The options for ensuring that allowed land uses are consistent with the function, capacity, and level of service of the facility identified in the TSP should be included in the Community Development Code, or Code language should reference the relevant TPR section.										
(3) Local governments shall adopt land use or subdivision regulations for urban areas and rural communities as set forth in 660-012-0040(3)(a-d):											
(a) Provide bicycle parking in multifamily developments of 4 units or more, new retail, office and institutional developments, transit transfer stations and park-and-ride lots	The matrix under 46.150(D), Bicycle Facilities and Parking, includes requirements that meet this TPR requirement.										
(b) Provide "safe and convenient" (per subsection 660-012-0045.3(d)) pedestrian and bicycle connections from new residential and commercial development to adjacent residential areas and transit stops and to neighborhood activity centers; bikeways are required along arterials and major collectors; sidewalks are required along arterials, collectors, and most local streets in urban areas except controlled access roadways	Section 48.080 Bicycle and Pedestrian Circulation requires that individual units within multifamily developments be connected to parking, open space, and recreational areas by pedestrian pathways. However, this section does not require that new residential developments be connected to other residential areas or to activity areas outside the development. Similarly, Code provisions in this section specify that bicycle and pedestrian facilities within subdivisions must comply with right-of-way width standards (85.200(A)(3)(e)), but not that such facilities are

	required to connect new development with other residential, commercial and recreational areas.										
	Commercial/OBC zone development on arterials requires a 12-foot wide sidewalk; Commercial/OBC zone development on local streets requires an 8-foot wide sidewalk (85.200(A)(3)(e), Ord. 1408).										
	Per 92.010(H), Public Improvements for all Development, sidewalks are required on both sides of a public street and in any special pedestrian way within a subdivision. <sup>1</sup>										
	Per the Land Division Approval Criteria (85.200(A)(3)(f)) bike lanes are required on arterials and collector streets in new developments.										
	Section 92.010(I) states that the Planning Commission may require the installation of separate bicycle lanes within streets and separate bicycle paths if appropriate to the extension of a system of bicycle routes, existing or planned.										
	Submittal requirements for tentative plans include showing any proposed bicycle or pedestrian paths (85.160 (F)(3)).										
	Recommendation: Section 48.080 Bicycle and Pedestrian Circulation should include development standards that address pedestrian and bicycle connections between new residential and commercial developments and connecting new development to "activity centers."										
(c) Off-site road improvements required as a condition of development approval must accommodate bicycle and pedestrian travel, including facilities on arterials and major collectors	Per Section 85.170(B)(2), Supplemental Submittal Requirements for a Tentative Subdivision or Partition Plan, Transportation, the City Engineer has the authority to require a transportation analysis report if s/he determines that the proposed development may have off-site traffic impacts. The report must specify what specific street or traffic improvements would be necessary to mitigate off-site traffic impacts. Based upon the City Engineer's determination, the applicant is required to construct (or to contribute a proportionate share of the costs) all necessary off-site improvements identified by the transportation analysis that are required to mitigate impacts from the proposed subdivision (85.200(A)(22), Approval Criteria for Street).										
	Recommendation: Code language should be modified to clarify that off-site road improvements required as a condition of development approval must accommodate bicycle and pedestrian travel.										
(e) Provide internal pedestrian circulation within new office parks and commercial developments	Through the Design Review provisions, the City has discretion to require pedestrian and bicycle connections in new commercial and office development (Approval Standards – Class II Design										

<sup>&</sup>lt;sup>1</sup> Per this Code provision, the Planning Commission may approve a subdivision without sidewalks in the case of primary or secondary arterials, special type industrial districts, or special site conditions if alternate pedestrian routes are available.

	Review, TPR Compliance, Section 55.100(B)(7)).								
(6) As part of the pedestrian and bicycle circulation plans, local governments shall identify improvements to facilitate bicycle and pedestrian trips to meet local travel needs in developed areas.	Recommendation: This requirement should be addressed by the TSP update planning process. The requirement can be met by adopting a list of improvements in developed areas that meet the needs identified in the TSP's pedestrian and bicycle circulation elements.								
(7) Local governments shall establish standards for local streets and accessways that minimize pavement width and total ROW consistent with the operational needs of the facility.	The table referenced in 85.200(A)(3)(e) in the Land Division chapter of the Code contains the City's road design standards, road construction standards and access requirements.								
	The required roadway (pavement) and road right-of-way widths vary depending on the type of facility and the configuration of bike lanes and parking. For example, City Code does not differentiate between major and minor collector and the "Collector" street design includes no parking with bike lanes, parking on both sides without bike lanes, andparking on one side with and without bike lanes.								
	The City's local street width requirements are as follows:								
	Roadway Right of-Way No On-Street Parking 20' 44' Parking on One Side 28' 52' Parking on Two Sides 32' 56'								
	Right-of-way and roadway widths may be modified by the City Engineer or the approval authority in 85.200(A)(2) in order to accommodate larger tree-lined boulevards, sidewalks and other "amenities." Ranges provided generally would allow for wider right-of-ways than the standards in the table under 85.200(A)(3) and wider than standards in the adopted TSP (see following discussion).								
	The Width Standards table in 85.200(A)(3) is not consistent with the standards in the Street Element of West Linn's adopted TSP. The TSP standards require a 24' pavement width within a 46' right-of-way for a local residential street with no parking. The TSP standards also include two options for a local residential street with parking on both sides; either a 28' or a 32' paved roadway within a 50' right-of-way. These standards are consistent with guidelines developed by the Department of Land Conservation and Development to comply with the TPR requirement to minimize pavement width and total ROW. The Neighborhood Street Width Guidebook suggests the following local street standards:  Pavement Right-of-Way  No On-Street Parking 20' 42-48'  Parking on One Side 24' 47-52'								
	Parking on Two Sides 28' 52-56'								
	Recommendations: The City's street standards should be amended to provide for narrower street roadway (pavement) options, consistent with the adopted TSP and the model

	language listed above.				
	In addition, the text in Section 85.200(A)(3)(e) indicates that there are two widths identified in the table, the "minimum" and "desirable" and that the desirable width is the required width unless the applicant can demonstrate that site conditions, topography, or site design require the reduced minimum width. The street standards table does not reflect this provision and the text and table should be reconciled.				
	Consideration should be given to eliminating the Discretionary authority granted to the City Engineer or "approval authority" in 85.200(A)(2) and, if desired, incorporating reasonable ranges for roadway and right-ofway widths in a modified street widths standards table.				
TPR Requirement (OAR Section 660-12-0060)	Ordinance Compliance/Recommendations				
Amendments to functional plans, acknowledged comprehensive plans, and land use regulations that significantly affect an existing or planned transportation facility shall assure that allowed land uses are consistent with the identified function,	Recommendations: Revise the Community Development Code to include language that is consistent with the language of the TPR.				
capacity, and performance standards of the facility.	Section -0060 was amended in March 2005 and includes new provisions for local jurisdictions on how to make a determination whether or not an amendment to the City adopted plans or land use regulations has a significant affect on a transportation facility.				
	The TPR includes a category of facilities, improvements, and services that can be assumed to be "in-place" or committed and available to provide transportation capacity (-0060)(4)). For the City of West Linn, these include projects in the STIP or locally adopted TIP or CIP and projects that are authorized in the local TSP for which a funding plan or mechanism is in place.				
	The TPR also allows applicants and decision-makers to rely on transportation improvements that are "reasonably likely to be provided by the end of the planning period" (-0060 (4)(b)(D) when considering amendments to local plans and land use regulations. Through this TSP update process, the City of West Linn has an opportunity to identify what, if any, planned improvements in the adopted TSP may be considered "reasonably likely" to be funded and built within the 20-year planning horizon.

# **Appendix D: Level of Service Descriptions**

#### TRAFFIC LEVELS OF SERVICE

Analysis of traffic volumes is useful in understanding the general nature of traffic in an area, but by itself indicates neither the ability of the street network to carry additional traffic nor the quality of service afforded by the street facilities. For this, the concept of *level of service* has been developed to subjectively describe traffic performance. Level of service can be measured at intersections and along key roadway segments.

Level of service categories are similar to report card ratings for traffic performance. Intersections are typically the controlling bottlenecks of traffic flow and the ability of a roadway system to carry traffic efficiently is generally diminished in their vicinities. Levels of Service A, B and C indicate conditions where traffic moves without significant delays over periods of peak travel demand. Level of service D and E are progressively worse peak hour operating conditions and F conditions represent where demand exceeds the capacity of an intersection. Most urban communities set level of service D as the minimum acceptable level of service for peak hour operation and plan for level of service C or better for all other times of the day. The *Highway Capacity Manual* provides level of service calculation methodology for both intersections and arterials. The following three sections provide interpretations of the analysis approaches.

<sup>&</sup>lt;sup>1</sup> 2000 Highway Capacity Manual, Transportation Research Board, Washington D.C., 2000, Chapters 16 and 17.

#### ALL-WAY STOP CONTROLLED INTERSECTIONS

Unsignalized intersections and all-way stop controlled intersections are each subject to a separate capacity analysis methodology. All-way stop controlled intersection operations are reported by leg of the intersection.

This method calculates a delay value for each approach to the intersection. The 2000 Highway Capacity Manual describes the detailed methodology. The following table describes the amount of delay associated with each level of service.

Delay (Seconds)	Level of Service
0 - 10	A
10 - 15	В
15 - 25	С
25 - 35	D
35 - 50	Е
> 50	F

#### **UNSIGNALIZED INTERSECTIONS (Two-Way Stop Controlled)**

Unsignalized intersection level of service is reported for the major street and minor street (generally, left turn movements). The method assesses available and critical gaps in the traffic stream which make it possible for side street traffic to enter the main street flow. The 2000 Highway Capacity Manual describes the detailed methodology. It is not unusual for an intersection to experience level of service E or F conditions for the minor street left turn movement. It should be understood that, often, a poor level of service is experienced by only a few vehicles and the intersection as a whole operates acceptably.

Unsignalized intersection levels of service are described in the following table.

Expected Delay	(Sec/Veh)	
Little or no delay	0-10.0	
Short traffic delay	>10.1-15.0	
Average traffic delays	>15.1-25.0	
Long traffic delays	>25.1-35.0	
Very long traffic delays	>35.1-50.0	
Extreme delays potentially affecting other traffic movements in the intersection	> 50

#### SIGNALIZED INTERSECTIONS

For signalized intersections, level of service is evaluated based upon average vehicle delay experienced by vehicles entering an intersection. Control delay (or signal delay) includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. In previous versions of this chapter of the HCM (1994 and earlier), delay included only stopped delay. As delay increases, the level of service decreases. Calculations for signalized and unsignalized intersections are different due to the variation in traffic control. The 2000 Highway Capacity Manual provides the basis for these calculations.

(secs.) <10.00	Tree Flow/Insignificant Delays: No approach phase is fully utilized by traffic and no vehicle wai longer than one red indication. Most vehicles do not stop at all. Progression is extremely favorable ar
≤10.00	
	most vehicles arrive during the green phase.
10.1-20.0	<b>Stable Operation/Minimal Delays:</b> An occasional approach phase is fully utilized. Many drivers beg to feel somewhat restricted within platoons of vehicles. This level generally occurs with good progressic short cycle lengths, or both.
20.1-35.0	<b>Stable Operation/Acceptable Delays:</b> Major approach phases fully utilized. Most drivers feel somewherestricted. Higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level, and the number of vehicles stopping is significant.
35.1-55.0	<b>Approaching Unstable/Tolerable Delays:</b> The influence of congestion becomes more noticeable Drivers may have to wait through more than one red signal indication. Longer delays may result fro some combination of unfavorable progression, long cycle lengths, or high v/c ratios. The proportion vehicles not stopping declines, and individual cycle failures are noticeable.
55.1-80.0	<b>Unstable Operation/Significant Delays:</b> Volumes at or near capacity. Vehicles may wait though sever signal cycles. Long queues form upstream from intersection. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are a freque occurrence.
≥80.0	<b>Forced Flow/Excessive Delays:</b> Represents jammed conditions. Queues may block upstreat intersections. This level occurs when arrival flow rates exceed intersection capacity, and is considered be unacceptable to most drivers. Poor progression, long cycle lengths, and v/c ratios approaching 1.0 m contribute to these high delay levels.

# **Appendix H: Neighborhood Traffic Management Options**

#### **Neighborhood Traffic Management 'Tool Box'**

NTM consists of many different options, which need to be tailored to the specific problems occurring. NTM alternatives are categorized into the type of management devices that include vertical deflection, horizontal deflection, volume control measures, and other elements. The following matrix outlines the recommended application of the different NTM options based on NTM alternative and the streets functional classification.

Neighborhood Traffic Management 'Tool Box' **Functional Classification** Neighborhood Route ocal Street Collector Arterial **NTM Device** Description Sample Horizontal Deflection **Bulb-Outs** The bulbous extension of the sidewalk at an intersection to decrease the  $\otimes$ walking distance for pedestrians and reduce roadway width. Center Island Narrowing A roadway narrowing with a center median used for reducing speed, site access  $\otimes$ restriction to rightin and right-out, or as a pedestrian refuge. # **Appendix I: 10<sup>th</sup> Street Corridor Area Plan**

# 10<sup>th</sup> Street Area Plan

This section presents an in-depth evaluation of the 10<sup>th</sup> Street area for the West Linn Transportation System Plan (TSP) including existing and future performance deficiencies for all modes of transportation, alternatives evaluation, preliminary cost estimates, and recommendations for TSP projects in the study area.

The physical constraints, intensity of land uses and the desired street design standards have created significant challenges in effectively serving this area of the community. Issues were discussed and alternatives were developed by the 10<sup>th</sup> Street Traffic Task Force in a series of meetings held December 2006 through summer of 2007.

The 10<sup>th</sup> Street corridor is the area generally bounded by the confluence of Blankenship Road, Salamo Road, I-205, 10<sup>th</sup> Street and Willamette Falls Drive. The following intersections were included for evaluation of the 10<sup>th</sup> Street area:

- Blankenship Road / Tannler Drive
- 10th Street / Blankenship Road (ODOT)
- 10th Street / I-205 SB ramps (ODOT)
- 10th Street / I-205 NB ramps (ODOT)
- 10th Street / 8th Avenue 8th Court
- 10th Street / Willamette Falls Drive
- Willamette Falls Drive / 12th Street
- Willamette Falls Drive / 19th Street

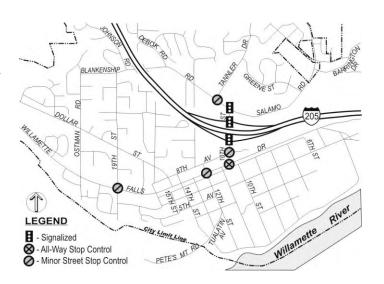

Figure 1: 10th Street Study Area

# **Constraints and Opportunities**

# Land Use

As is typical of many urban freeway interchange areas, the land uses nearby the 10th Street interchange with I-205 (Exit 6) is primarily commercial retail and office type, and the uses are clustered along Blankenship Road, Willamette Falls Drive, and 8th Avenue and 8th Court. Many of the vacant parcels or existing businesses that may redevelop some day are also zoned commercial or office uses.

These types of uses, in general, attract a higher volume of traffic than a comparable sized parcel with residential or industrial users. The higher intensity leads to higher auto and truck volumes, and a general demand from local merchants for more frequent access points to their properties.

The three largest developments nearby the interchange include:

- Tannler West Property –Development area west of Tannler Road and north of Blankenship Road that has been approved by city council to construct commercial office uses, with access onto Tannler Road and onto Blankenship Road.
- Tannler East Property Development area east of Tannler Road and north of Blankenship Road – Salamo Drive that was previously denied a land use application for commercial office uses. Vehicle access would be provided on Tannler Road and Salamo Road.
- Willamette Shopping Center Development area west of 10th Street between 8th Avenue and I-205. Redevelopment project was approved and is current under construction.
   Vehicle access provided onto 8th Avenue.

Together, these three developments would generate<sup>1</sup> an estimated 1,030 PM peak hour vehicle trips. As part of the operational analysis, these trips were added to existing traffic volumes to test various transportation improvement alternatives developed to service long-term traffic conditions.

# **Traffic Operations**

Three of the study intersections are controlled by traffic signals along 10th Street. These are at 10th Street/Blankenship-Salamo Road, 10<sup>th</sup> Street / I-205 SB ramps and 10<sup>th</sup> Street / I-205 NB ramps. The first two traffic signals are operated by one traffic signal controller because of their close spacing, about 200 feet apart. The third signal was installed at the I-205 NB ramp terminals last year. A fourth traffic signal has been conditioned as part of the approval for the Willamette Shopping Center redevelopment project. This new signal would be at the 10<sup>th</sup> Street / 8<sup>th</sup> Avenue – 8th Court intersection, about 250 feet away from the signal at I-205 NB ramps. This new signal has not been supported by ODOT. The intersection of 10<sup>th</sup> Street/Willamette Falls Drive is all-way stop-controlled and the remaining intersections are stop-controlled on the minor approach.

Level of service, delay and volume to capacity ratios are used as measures of effectiveness for study intersection performance. ODOT operating performance standards<sup>2</sup> require intersections on I-205 to operate below a maximum volume-to-capacity (v/c) ratio of 0.99. The minimum operational standard specified in the City of West Linn Comprehensive Plan (April 2006) is LOS D for those 10<sup>th</sup> Street study area intersections that are not under ODOT jurisdiction.

The PM peak hour intersection volumes were used to determine the existing study intersection operating conditions based on the *2000 Highway Capacity Manual* methodology for signalized and unsignalized intersections<sup>3</sup>. Future volumes developed for the Transportation System Plan (TSP) were used to determine 2030 Base operating conditions.

<sup>&</sup>lt;sup>1</sup> The Willamette Marketplace Shopping Center was grandfathered in traffic volumes from pre-existing uses. Due to under-utilization of the site, the 10th St corridor will see additional trips but in reality those trips were already "part of the existing" traffic volumes

Notes: Two-way Stop controlled intersections:

 $A/A = Major\ street\ /\ Minor\ street\ turn\ LOS$ 

#/# = Major street / Minor street turn v/c

Referring to Table 1 above, the existing PM peak hour conditions generally are acceptable with the exception of the minor street stop-controlled movements for Tannler Drive and  $8^{th}$  Avenue. Also, the westbound (Salamo Road) approach at  $10^{th}$  Street/Blankenship-Salamo Road is LOS F with substantial queuing. Heavy truck volumes are higher at the interchange ramp intersections than at other intersections the city – about 5% of total PM peak volume.

Future year traffic forecasts were prepared with the Metro 2030 travel demand model. This model was refined for local planning purposes for the city's Transportation System Plan, and provides 2030 regional travel and land use data to make future forecasts. The raw 2030 model forecasts were adjusted better match traffic patterns and observed behaviors within the 10th Street area. The forecasts included all of the recently approved and pending developments within the city, and, specifically, the three large developments noted on the prior page. The resulting 2030 traffic forecasts were re-evaluated to determine how well the street and highway facilities would operate without significant improvements.

We found that nearly every major intersection in the  $10^{th}$  Street study area exceeds performance standards in 2030 with no changes to traffic control or lane configurations (see Table 2 on the following page). The change in volumes includes both local developments, added regional traffic from growth around the city, most notably the Stafford Basin area. It is expected that peak hour diverted traffic from I -205 would continue until such as time as the corridor is improved or other management measures taken to address the excessive regional demand.

As traffic conditions degrade, and delays become extensive, the close spacing of the intersections will compound the operational and safety issues here. For example, the 'good' conditions on 10th Street at 8th Avenue (LOS B for the 10th Street approaches) will be impacted by vehicle

queues from adjacent intersections that queue back into that intersection. Similarly, the LOS B conditions on WFD at 12th Street will be degraded because queues approaching 10th Street will routinely extend back into the 12th Street intersection. Because of the proximity of these locations, the overall system will reach and exceed capacity during peak hours without additional improvements or circulation changes.

# Pedestrians and Bicycles

The 10<sup>th</sup> Street area is primarily commercial, but pedestrian and bicycle traffic is low according to data gathered for the TSP. Ten or fewer pedestrians and two or fewer bikes were counted at each of the study intersections during the PM peak hour. There are five bus stops for TriMet bus route #154 in the study area. Although ridership is light for this route, two of the busiest stops according to the spring 2006 census were Blankenship Road/Tannler Drive and 10<sup>th</sup> Street/8<sup>th</sup> Avenue with 16 and 20 riders per day, respectively.

There is sidewalk on at least one side of the street along 10<sup>th</sup> Street and Blankenship Road. There is no sidewalk on Salamo Road. Willamette Falls Drive has sidewalk on both sides of the street west of 10<sup>th</sup> Street. Crosswalks are not marked at all legs of the signalized intersections on 10<sup>th</sup> Street, presumably to improve operations. Traffic is stop-controlled for crosswalks at 10<sup>th</sup> Street/Willamette Falls Drive. There is one uncontrolled, marked crosswalk at 8<sup>th</sup> Avenue across 10<sup>th</sup> Street.

The pedestrian signal crossing at the I-205 NB ramps and the stop-controlled crossing at Willamette Falls Drive are about 500 feet apart with 8<sup>th</sup> Avenue about midway in between the two. If the marked crosswalk at 8<sup>th</sup> Avenue was removed and no traffic signal installed, pedestrians at 8<sup>th</sup> Avenue wishing to cross 10<sup>th</sup> Street would need to walk about 500 feet (less than two standard blocks) round-trip out of direction to a controlled crossing location at I-205 NB ramps or Willamette Falls Drive.

# **Transportation Issues**

There are numerous transportation issues for the 10<sup>th</sup> Street study area that warrant special consideration. Intersection spacing along 10<sup>th</sup> Street is very short (between 250 and 600 feet), creating problems with traffic signal coordination and queuing during peak hours. There is limited nearby freeway undercrossings requiring the majority of local trips to pass through the interchange along with regional traffic that is entering or exiting the freeway. The closest freeway undercrossing is Blankenship Road via 19th Street, roughly one-half mile away from 10th Street. Heavy peak hour congestion on I-205 triggers diverted commute traffic along Willamette Falls Drive as a parallel route. These diverted commuters significantly increase peak hour volumes on Willamette Falls Drive, and at the interchanges at 10th Street and at Highway 43 (Willamette Drive), approximately two and a half miles to the east.

The 10<sup>th</sup> Street Traffic Task Force identified the following transportation issues to be addressed through this study, with the intent of carrying forward key solutions or options into the greater TSP efforts.

- 10<sup>th</sup> Street intersections approaching or below minimum standards.
- Traffic volumes on 10<sup>th</sup> Street growing.
- Access onto and across 10<sup>th</sup> Street at 8<sup>th</sup> Avenue difficult during peaks.
- Access onto and across Willamette Falls Drive difficult during peaks.
- Excessive peak hour traffic on Willamette Falls Drive due to freeway diversion.
- Close spacing of freeway ramp junctions to city street intersections.
- Interchange area serves access to and from and across the freeway. No nearby gradeseparated crossings.
- Limited street and pedestrian connections over or under I-205 between north-south Willamette.
- Limited alternative circulation to retail uses.
- Emergency vehicle response impacts as congestion grows.
- Lack of parking capacity on Willamette Falls Drive.
- Closure of Dollar Street in conjunction with bridge construction.

Alternatives analysis was focused first on solving major operational issues with improvements broken into groups appropriate for concurrent funding and construction, then on providing access alternatives specific to Tannler Drive and  $8^{th}$  Court.

# **Alternatives Analysis**

Numerous transportation improvement ideas were suggested by the Task Force to solve the identified transportation issues. The list of suggestions included those improvements previously recommended to mitigate planned developments, plus an array of ideas for the broader 10<sup>th</sup>

Street study area that included roadway extensions, roadway realignments, new or improved I-205 crossings, additional lanes, new traffic signals, four-way stop control, turn restrictions, and roundabouts. The initial list numbered over 30 suggestions, and, at first the Task Force attempted to score each of these suggestions against a wide range of criteria and concerns. About one-third of the solutions were then screened out based on criteria identified by Task Force. However, ultimately the discussion was directed to focus around how these suggestions met the primary needs identified by the Task Force, and also around the challenges involved with implementing them. This focusing effort helped to bundle the suggestions into three groups, as described below.

# Group A:

Improvement that primarily enhance peak hour operating capacity within the 10th Street corridor, and the existing interchange configuration. These improvements typically do not require additional right-of-way, and can be implemented with minimal review and approval between the city and ODOT.

# Group B:

Improvements that help to manage access on Willamette Falls Drive, and enhance circulation in the Willamette district area.

# Group C:

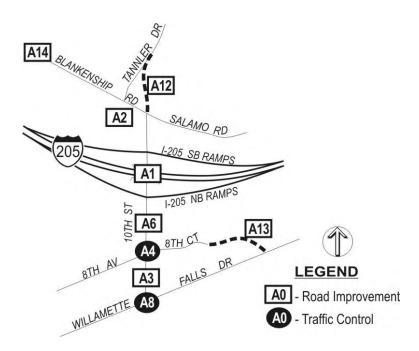

Major highway improvement concepts that would substantially alter the existing configuration. These would require major environmental and project programming analysis and review, and would involve both ODOT and FHWA approval.

The following sections summarize each group of improvements that were considered. Operational analysis of the 2030 No Build scenario and each group of improvements is summarized in Table 3, page 13.

The overall goal of each alternative circulation and operations concept was to serve local merchants and provide safe and convenient access to I-205.

# Group A: 10<sup>th</sup> Street Capacity Improvements within Existing Street Alignment

No.	Description
A1	Added through lanes on 10th Street for a total of 2 lanes each direction, plus center turn lane for left-turning movements.
A2	Added turn lanes on Blankenship Road and Salamo Road approaches.
A3	Added through lanes on 10th Street for a total of 2 lanes in each direction.
A4	Change/upgrade traffic control to either signal or roundabout
A6	Added turn lanes on northbound 10th St. and on the off-ramp.
A8	Change / upgrade traffic control to either signal or roundabout
A12	Realign Tannler Rd to 10 <sup>th</sup> St to reduce turning conflicts at nearby major intersection.
A13	Extend 8 <sup>th</sup> Ct to Willamette Falls Dr. to provide additional access to 8th Court retail,
A14	Change/upgrade traffic control

# Big Ideas:

- Add roadway capacity to 10th Street approaches to reduce vehicle queues and shorten delays during peak hours.
- Upgrade traffic controls at major intersections to serve higher traffic flows.
- Extend or re-align local roadways to mitigate closely spaced side streets, and allow for better traffic flow and safety.

#### Findings:

- Consistent with short-term Traffic Impact Analysis recommendations.
- Consistent with past plans.
- Targets capacity shortcomings on 10th Street.
- Most projects can be implemented with local funding and approvals.
- Not sufficient for long-term needs, at most 10 years of growth.
- Some investments would be 'discarded' at a later date (e.g., traffic signal at 10th Street and 8th Avenue).

# Operational Results:

- Capacity improvement enough to make core locations work within standards.
- Significant vehicle queues spill back and block upstream intersections.

#### Recommendations:

 Advance all elements to TSP stage, except A12, which has major cost with minimal operational gain.

# Comments:

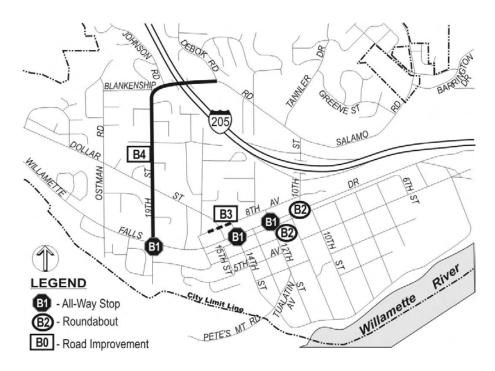

The majority of these improvements will be constructed as conditions of approval on new development. This would include A1, A2, A3, A4, A6, and A14.

There are on-going negotiations between the City of West Linn and ODOT about the proposed traffic signal (A4) at 8<sup>th</sup> Avenue. At present, these negotiations would provide specific guidelines and criteria for removing the traffic signal, and replacing it with other controls if traffic conditions become severely congested.

Also, the new location for the re-aligned Tannler Road was evaluated in further detail later in this section.

# Group B: Willamette Falls Drive Improvements to Manage Peak Hour Traffic

No.	Description
B1	Change / upgrade traffic control – All-way Stop at 12th, 14th and 19th Street
B2	Change / upgrade traffic control – Roundabout
В3	Modify Dollar St connection to reconnect to 8th Avenue, and provide alternative route for local trips.
B4	Upgrade 19th Street and connection to Blankenship Road to current city standards, including bike lanes, sidewalks, and turns lanes.

# Big Ideas:

- Provide better access to and from and across Willamette Falls Drive (WFD) during peak hours.
- Upgrade traffic controls along WFD at key cross streets.
- Re-connect 8th Avenue and Dollar Street to local trips stay off of WFD.

# Findings:

- No specific planned improvements; except at Willamette Falls Drive and 10<sup>th</sup> Street.
- Solutions target peak period 'through' traffic management; accessibility for locals.
- Roundabout would require property acquisition. (Minimum 130' diameter).

- All-way STOP would have enforcements issues; maybe select fewer locations.
- Various streets need to be upgraded to current standards (e.g., 8<sup>th</sup> Avenue).

# Operational Results:

- Roundabouts probably not the 'best fit' for Willamette Falls Drive at either 10<sup>th</sup> Street or 12<sup>th</sup> Street.
- Traffic signals or all-way stop control are better solutions.
- 12<sup>th</sup> Street cannot operate in long-term without traffic signal controls.
- 19<sup>th</sup> Street upgrade to current city standards relieves Willamette Falls Drive and 10<sup>th</sup> Street by 100 to 200 vehicles in peak hour.
- Minor 'negative' impact at Blankenship Road/10<sup>th</sup> Street because of higher east-west through traffic.

# **Recommendations:**

- Advance all elements to TSP stage.
- Add upgrading 8<sup>th</sup> Avenue from 10<sup>th</sup> Street to 12<sup>th</sup> Street, at least, as a needed improvement. Preferred to upgrade for extent between Dollar Street and 10<sup>th</sup> Street.
- Drop roundabouts from consideration at 12th Street.
- Pursue more detailed preliminary engineering evaluation regarding the benefits and expected costs of a roundabout at WFD and 10<sup>th</sup> Street.
- WFD/12<sup>th</sup> Street should be upgraded to a 4-way stop controlled intersection in the short-term. Ultimately, a traffic signal control is expected to be required.
- WFD/19<sup>th</sup> Street should be upgraded to a 3-way stop controlled intersection, when warrants are met.
- Additional opportunities for off-street parking lots should be investigated.

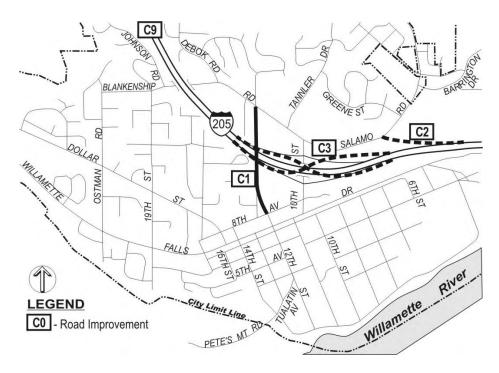

#### Comments:

Further investigation is recommended for the optimal traffic control solution on WFD at 10<sup>th</sup> Street. This additional engineering study could be in parallel with the TSP work, or under a separate study later. The roundabout concept has operational concerns by 2030, because of high turning volumes, but this is largely associated with diverted regional freeway traffic. Measures taken in the Group B package of improvements do work to improve access in the Willamette District even during peak hour conditions. Other measures to reduce freeway diversion would require a more regional scale solution, in coordination with ODOT.

A more detailed layout of a roundabout, and further review of its construction feasibility is recommended to better understand these issues. Specifically, potential impacts to existing residences, and the maximum allowable cross-slope within the circulation area should be further reviewed. Provision of a roundabout could allow for U-turns from southbound 10th Street back towards I-205, which could not be accommodated, as readily, with a conventional traffic signal configuration.

# Group C: Major System Improvements that Require Multi-Agency Review and Approval

No.	Description
C1	Construct new 13th Street overpass to I-205 to provide alternative route for local trips.
C2	New freeway ramp (SB access onto Salamo Road).
C3	Modify existing interchange (Single Point Urban Interchange)
C9	Add corridor capacity or demand management on I-205

# Big Ideas:

- Consolidate existing configurations into a single point interchange, to improve intersection spacing with nearby city streets. This configuration would consolidate the two existing ramp terminals
- Add new ramp alignments to reduce volume through existing ramps. Existing off-ramp alignments would likely have to be modified to add new ramps.
- Add new highway overcrossing to give local trips alternative route across I-205.

# Findings:

 Adding new off-ramp to connect with Salamo Road further uphill would require moving the initial exit point from the freeway further to the east. One ramp would be provided

with two optional terminal points, one at 10th Street as exists today, and one uphill at Salamo Road. However, this modification would also shorten the separation on the freeway mainline between the end of the on-ramp from Highway 43 and the off-ramp to 10th Street. This is a critical performance standard, and would require a design exception from ODOT.

- Each project in Group C would be at least \$5 million and higher to construct.
- Solutions target long-range system-level issues.
- Some have major property impacts and implications.
- Extensive inter-agency review required, including the City of West Linn, Clackamas County, and ODOT.
- Environmental assessment would be needed for any federally funded improvements, specifically the freeway ramp modifications.
- The project development, approval, funding and construction process would likely require 10 years or more to implement.
- Given the scale and complexity of issues within Group C, it is best to address them through the city TSP and the Metro RTP process.

# Operational Results:

- 13<sup>th</sup> Street overpass draws roughly 400 vehicle trips during the peak hour off of 10<sup>th</sup> Street modest benefit to 10<sup>th</sup> Street core intersections.
- 2<sup>nd</sup> SB off-ramp to Salamo Road draws substantial traffic out of the 10<sup>th</sup> / Blankenship / Salamo intersection during the PM peak hour. However, this improvement would not significantly enhance the extensive queues in the AM peak hour for vehicles on Salamo Road that intend to get onto I-205 northbound for the morning commute. The benefit would be limited primarily to the aftermoon hours.
- Analysis not completed: Benefits of SPUI configuration.

# Recommendations:

- Advance the SPUI design concept at 10th Street to the TSP for consideration.
- Advance preference for additional I-205 corridor capacity to be incorporated into the Motor Vehicle Master Plan in the TSP, to be implemented by the State.
- Drop other elements.

#### Comments:

The modification I-205 SB off-ramp was aimed at separating out the PM peak hour traffic that intends to exit the freeway, turn right and continue uphill on Salamo Road. By adding a new optional terminal point, this substantial volume would not have to pass through the interchange area. However, further investigation raised up a few key issues. First, the design of the dual off-ramp would necessitate relocating the initial exit point further north, which would shorten the distance between the end of the on-ramp from Highway 43 to the start of the off-ramp to 10th Street. This distance is a critical safety issue for ODOT and FHWA.

Secondly, the concept of the design was targeted at the PM peak hour, and would have some benefit during that period; however, it would have very little benefit other hours of the day when usage levels are much reduced. ODOT prefers to invest in improvements that have broader general benefits to users. Given these two key issues, the concept of the 2nd off-ramp to Salamo Road was set aside from further consideration.

The operational results from the three groups of alternative improvements are summarized in Table 3 below. To review, the No Build scenario predicts severe peak hour congestion at nearly all of the key study intersections within the 10th Street Area Plan. The Group "A" projects would implement many of the improvements that have been attached to on-going or pending development, and they would significantly address congestion at the core intersections, from Blankenship Road – Salamo Road to Willamette Falls Drive. Group "B" projects have essentially the same results for the core area, with better conditions along Willamette Falls Drive. Note that with Group "B", the intersection of Willamette Falls Drive and 12th Street be upgraded to either a traffic signal or roundabout, which resolves the peak period delays there. Installing all-way stop controls at 19<sup>th</sup> Street is less appropriate, since side street volumes are much lower. A better solution at 19<sup>th</sup> Street and WFD may be to widen WFD for an eastbound left-turn pocket and refuge areas. The refuge area on the east leg would allow for a two-stage left turn from 19<sup>th</sup> Street onto WFD. Finally, with Group "C", there are minor marginal reductions in peak hour volumes at the core intersections because of the introduction of the 13th Street overcrossing connection. In all cases, the first intersection at Blankenship / Tannler will not operate satisfactorily without either traffic signal controls for the side street, or turn restrictions on the side street to alternate routes.

# **Tannler Road Access Alternatives**

The existing alignment of Tannler Road tees into Blankenship Road about 300 feet west of 10<sup>th</sup> Street and 350 feet east of existing commercial driveways that have been approved for a new traffic signal. The problems with this configuration include excessive queuing on both streets, left turn conflicts, and excessive delays. Three alternatives were developed to address these problems. Each alternative has significant impacts to access to both developed and undeveloped commercial properties north and south of Blankenship Road. Another obstacle to realignment of Tannler Road is the steep terrain north of Blankenship Road; additional study would be required to determine a feasible alignment. Tables 4 and 5 describes each alternative that was considered and the merits of each.

Table 4: Access Alternatives for Tannler Road at Blankenship Road

#### **Alternative 1: Turn Movement Restrictions**

Construct raised median on Blankenship at first driveway west of 10th Street to limit turns to right-in / right-out only (RIRO). This concept could also be modified to include a left-turn ingress into the first commercial driveway.

Pros: • Median eliminates left turn conflicts on Blankenship Rd by moving left turns to the proposed traffic signal.

Cons: 
Tannler Road does not have left turn access – left-turning vehicles are required to find another route such as cutting through parking lots of future commercial developments or using Greene St, which would increase traffic on Salamo Rd

 Change in access patterns to shopping center on south side could increase on-site circulation.

Alternative 2: Realignment of Tannler to 10<sup>th</sup> Street Re-align Tannler Road west to align with 10th Street. Restrict access at 1st driveway to RIRO.

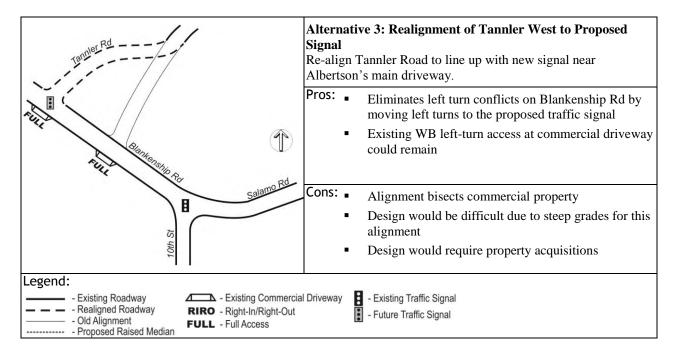

Pros: • Eliminates left turn conflicts on Blankenship Rd by moving left turns to the existing traffic signal

 Direct site access for vacant land zoned for office uses (Tannler East)

Cons: • Adding a fourth leg to the intersection of 10<sup>th</sup> St /Salamo Rd would severely degrade traffic operations.

- Alignment bisects commercial property (Tannler East site), and would reduce buildable area.
- Design would be difficult due to steep grades for this alignment
- Change in access patterns to shopping center on south side could increase on-site circulation.

# **Findings**

Alternative 1 is the least expensive Tannler Road access alternative to implement, and would have significant benefits to safety and level of service at the expense of requiring motorists to sometimes take more circuitous routes to their destinations. Alternative 2 would severely deteriorate the performance of the 10<sup>th</sup> Street/Blankenship Road intersection with the current interchange configuration. Alternative 3 is probably the most difficult and expensive alternative to implement, but has the most benefits to long-term capacity and safety, not only for vehicles, but also for pedestrians. Another variation of Alt. 3 would be to extend Greene Street westerly, to provide alternative access for residents that now use Tannler Road for their primary access.

The Task Force indicated that Alt. 3 was the preferred option. However, further engineering review is needed to determine the feasibility of such an extension, if this improvement is to be incorporated into the ultimate circulation solutions identified by new development on either side of Tannler Road. Table 5 lists key factors for each Tannler Road access alternative and how each alternative measures up.

# 8<sup>th</sup> Court Access Alternatives

Properties that access 8<sup>th</sup> Avenue and 8<sup>th</sup> Court at 10<sup>th</sup> Street are primarily commercial. A new traffic signal at 8<sup>th</sup> Avenue/10<sup>th</sup> Street has been approved for a new development west of 10<sup>th</sup> Street. This intersection is 300 feet south of I-205 northbound ramps/10<sup>th</sup> Street, which is currently signalized, and 250 feet north of Willamette Falls Drive/10<sup>th</sup> Street, which is currently all-way stop controlled, but a traffic signal is planned. The signal spacing on 10<sup>th</sup> Street after installation of the two planned signals will be too close for effective coordination or storage of queues. Four alternatives have been developed to address access and operational issues for 8<sup>th</sup> Avenue, 10<sup>th</sup> Street and Willamette Falls Drive. Table 6 describes each alternative that was considered and the merits of each. In all cases, it is assumed that the Group A and B improvements would be in place, aside from the issues specific noted below.

Table 6: Access Alternatives for 8th Court Access

# Alternative 1: No Extension of 8<sup>th</sup> Court

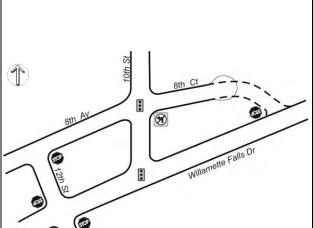

Traffic signal installed at 10th Street and 8th Avenue, per condition of approval of Willamette Shopping Center redevelopment

Pros: No property impacts for new ROW

Signal provides safe pedestrian crossing at 8<sup>th</sup>

Cons: • Queuing between signals impacts operations

Temporary improvement in traffic operations on 10<sup>th</sup> St; long-term demands make a signal at this location not viable.

# Alternative 2: Extension of 8<sup>th</sup> Court

Same as Alt. 1, plus westerly extension of 8th Court through private parking lot adjacent to Sharri's Restaurant, and continuing east through adjoining residential properties to a new connection with Willamette Falls Drive

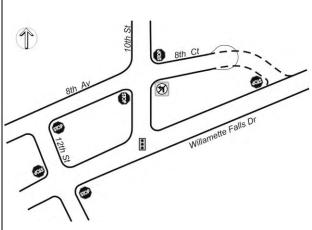

Pros: Improves connectivity

- Provides alternative access to existing and potential future businesses
- Potentially increases desirability of commercial property redevelopment where currently utilized as residential.

Cons: • Queuing between signals impacts operations

- May encourage cut-through traffic from WB
   Willamette Falls Dr to 10<sup>th</sup> Street
- Requires property acquisition
- Requires access easements through existing parking lots

# Alternative 3a: Extension of 8<sup>th</sup> Court with No Traffic Signal at 10<sup>th</sup> Street/8<sup>th</sup> Court

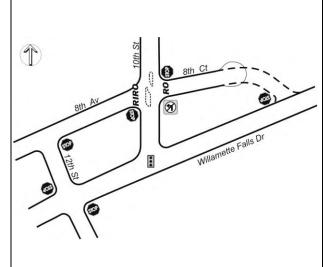

Variation on Alt. 2. The new traffic signal is not constructed, and existing STOP sign controls on side streets remain.

Pros: • Improves connectivity

 Provides greater signal spacing to improve coordination and queuing on 10<sup>th</sup> St

Cons: • Difficult left turns in and out at 8<sup>th</sup> cause longer queues and encourage drivers to accept inadequate gaps and greater risk

- Pedestrian crossing is difficult at 8<sup>th</sup>
- Requires property acquisition (Same as Alt. 2)

# Alternative 3b: Extension of 8<sup>th</sup> Court with No Traffic Signal at 10<sup>th</sup> Street/8<sup>th</sup> Court plus Turn Movement Restrictions

Variation on Alt. 3a. A median island on 10th Street would prohibit left-turns out from the side street onto 10th Street. However, it would allow for left-turns into 8th Court. Would include pedestrian refuge island on 10th Street on the south leg.

Pros: • Eliminates conflicts from EB and WB leftturning vehicles

- Improves traffic operations on 10<sup>th</sup> St
- Provide a pedestrian facility to cross 10th Street without a traffic signal.

Cons: • EB and WB left-turning vehicles are required to re-route to Willamette Falls Dr via 12<sup>th</sup> St or 8<sup>th</sup> Ct.

- Adds traffic volumes through intervening intersections for re-routed traffic, and worsens congestion during peak hours.
- Requires property acquisition (Same as Alt. 2)

Operational performance of each of the four access alternatives at 8<sup>th</sup> Court were evaluated and summarized in Table 7. This operational analysis suggests that Alternative 2 would yield the best *intersection* performance, but queuing problems with the short signal spacing would be significant. See the discussion following Table 7 for more details.

Notes:

These results assume Group A improvements are in place unless modified by an alternative. Group A includes NB left turn restriction at  $10^{th}/8^{th}$ , new signals at  $10^{th}/8^{th}$  and  $10^{th}/8^{th}$  and  $10^{th}/8^{th}$ . Group A analysis assumed  $8^{th}$  Court extension, but Alternative 1 does not.

 $LOS = Level \ of \ Service$ 

Delay = Average vehicle delay in the peak hour for entire intersection in seconds.

Unsignalized Intersection Operations (highlighted in gray):

A/A = Major street turn LOS / Minor street turn LOS

#/# = Major street turn v/c / Minor street turn v/c

Although the intersection at 10<sup>th</sup> Street/8<sup>th</sup> Avenue appears to operate well with a signal (Alternatives 1 and 2 above) based on LOS and v/c, there would be severe queuing issues by 2030. Intersection spacing along 10<sup>th</sup> Street is very short, 250 feet from Willamette Falls Drive to 8<sup>th</sup> Avenue and 300 feet from 8<sup>th</sup> Avenue to I-205 NB ramps. In traffic simulation runs, storage in the northbound lanes at I-205 NB ramps is frequently full, preventing 8<sup>th</sup> Avenue and 8<sup>th</sup> Court traffic from making turns into those lanes during the side street green time. The same problem would exist for the northbound lanes at 8<sup>th</sup> Avenue, preventing Willamette Falls Drive traffic from entering 10<sup>th</sup> Street and causing long queues along Willamette Falls Drive. The addition of a WB right turn lane at 10<sup>th</sup> Street/Willamette Falls Drive improves this queuing situation.

Eliminating the traffic signal and imposing turn restrictions (Alternative 3b above) would improve operational performance at 10<sup>th</sup> Street/8<sup>th</sup> Avenue, but would redirect traffic to Willamette Falls Drive, impacting both 10<sup>th</sup> Street/Willamette Falls Drive and 12<sup>th</sup> Street/Willamette Falls Drive.

# **Findings**

The foregoing analysis assumed that the Group B improvements would be implemented and that the 8th Avenue connection to Dollar Street would be re-established. With that as a premise, Alternative 1 is the least expensive 8<sup>th</sup> Court access alternative to implement, but would have the most detrimental effect on traffic operations for the 10th Street corridor. Alternative 2 would also deteriorate the performance along 10<sup>th</sup> Street, but it would provide alternate access to commercial properties on 8<sup>th</sup> Court. Installing a signal at 8<sup>th</sup> Court would benefit pedestrian crossings at 10<sup>th</sup> Street; however, adjacent intersections with crosswalks are very close and not an unreasonable distance for pedestrians to walk out of direction when traffic is too heavy to safely cross 10<sup>th</sup> Street. Furthermore, the ultimate design for the 10th Street / 8th Court intersection could include pedestrian refuge areas in the median to facilitate crossings without

<sup>\*</sup> Performance can be mitigated to LOS D and v/c of 0.79 with the addition of a second EB left turn lane.

<sup>\*\*</sup> Performance can be mitigated to LOS D and v/c of 0.98 with a signal, NB right turn lane with overlap, and left turn lanes with protected phasing on all legs.

signals. An example of a pedestrian refuge is illustrated in the photograph below. Similar refuge areas are built on Highway 43 south of McVey Avenue in Lake Oswego near the residential districts.

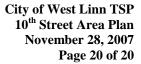

Figure 1: Example of Center Refuge Median on Two-Lane Street

Additional turn restrictions are the only difference between Alternative 3a and 3b. Restricting left turns from 8<sup>th</sup> Court and 8<sup>th</sup> Avenue improves traffic operations and provides a pedestrian refuge for crossing 10<sup>th</sup> Street. Table 8 lists key factors for each 8<sup>th</sup> Court access alternative and how each alternative measures up.

# **Conclusions**

The 10<sup>th</sup> Street Area Plan identified a series of findings and recommendations that will be carried forward into the citywide Transportation System Plan . However, a few issues were deferred for further study and public discussion in that broader planning context. The solutions in the general area of 10<sup>th</sup> Street were divided into three groups, and the recommendations to date are identified for each group below.

# Group A: 10<sup>th</sup> Street Capacity Enhancements

- Advance project elements referred to as A1, A2, A3, A4, A6, A8, A13 and A14 to the Transportation System Plan as recommended improvement projects to be included in the Master Plan motor vehicle list.
- Set project A12 aside, the re-alignment of Tannler Drive to line up with 10<sup>th</sup> Street, from further consideration.
- Conduct further preliminary engineering study at A8 (WFD and 10<sup>th</sup> Street) to determine the most appropriate traffic control solution there. The long-term need for traffic signal controls at this location would need to consider the proximity of traffic signals at 10<sup>th</sup> Street and 8<sup>th</sup> Court, and WFD and 12<sup>th</sup> Street, and consider the operational efficiencies of such a configuration.

# Group B: Willamette Falls Drive Enhancements and Management Tools

- Advance projects B1, B2, B3, and B4 to TSP stage.
- Add upgrading 8<sup>th</sup> Avenue from 10<sup>th</sup> Street to 12<sup>th</sup> Street, at least, as a needed improvement. Preferred to upgrade for extent between Dollar Street and 10<sup>th</sup> Street.
- Drop roundabouts from consideration at 12th Street and WFD.
- Pursue more detailed preliminary engineering evaluation regarding the benefits and expected costs of a roundabout at WFD and 10<sup>th</sup> Street.
- WFD/12<sup>th</sup> Street should be upgraded to a 4-way stop controlled intersection in the short-term. Ultimately, a traffic signal control is expected to be required.
- WFD/19<sup>th</sup> Street should be upgraded to a 3-way stop controlled intersection, or WFD should be widened for a left-turn pocket, and an area to make two-stage left-turns.
- Additional opportunities for off-street parking lots should be investigated to better manage peak parking demands along WFD between 10<sup>th</sup> Street and 14<sup>th</sup> Street.

# Group C: Major System Improvements

- Advance the SPUI design concept at 10th Street to the TSP for consideration (C3).
- Advance preference for additional I-205 corridor capacity to TSP, and to the Advance the SPUI design concept at 10th Street to the TSP for consideration.
- Advance preference for additional I-205 corridor capacity to TSP and to the Regional Transportation Plan.
- Drop other elements of Group C from further consideration.
